Introduction

The *Financial Statistics of Major U.S. Investor-Owned Electric Utilities* publication presents summary and detailed financial accounting data on the investor-owned electric utilities. The objective of the publication is to provide Federal and State governments, industry, and the general public with current and historical data that can be used for policymaking and decisionmaking purposes related to investor-owned electric utility issues.

Background

The *Financial Statistics of Major U.S. Investor-Owned Electric Utilities* publication is prepared by the Renewable and Financial Data Systems and Outreach Branch; Survey Management Division; Office of Coal, Nuclear, Electric and Alternate Fuels; Energy Information Administration (EIA); U.S. Department of Energy. Financial statistics for major investor-owned electric utilities have been compiled and published annually since 1938 to satisfy the requirements for accurate, readily available data regarding the electric power industry. The format was designed to be used by a variety of private, electric power industry, and government users. The publication contents and format have evolved over the years to better serve the needs and requirements of the targeted audience.

As the result of the Federal Power Act of 1935, the Federal Power Commission (FPC), which was the predecessor to the Federal Energy Regulatory Commission (FERC), began collecting financial statistics for investor-owned electric utilities in 1938. The EIA upon its establishment in October 1977 took over the responsibility of gathering and publishing the financial statistics on behalf of the FERC. In 1982, the EIA combined the contents of two publications containing financial statistics of investor-owned (private) and publicly owned electric utilities into a single volume, the *Financial Statistics of Selected Electric Utilities*. The 1989 edition reverted to the two separate publications, the *Financial Statistics of Selected Investor-Owned Electric Utilities* and the *Financial Statistics of Selected Publicly Owned Electric Utilities*. In 1991, the publication titles were changed to the *Financial Statistics of Major*

Investor-Owned Electric Utilities and the *Financial Statistics of Major Publicly Owned Electric Utilities*. In 1992, the publications titles were further changed to the *Financial Statistics of Major U.S. Investor-Owned Electric Utilities* and the *Financial Statistics of Major U.S. Publicly Owned Electric Utilities*.

The U.S. electric power industry is a combination of electric utilities (investor-owned, publicly owned, Federal, and cooperatives) and nonutility power producers. Investor-owned electric utilities account for over three-fourths of electric sales and revenue. Historically, the investor-owned electric utilities serve the large consolidated markets. There is substantial diversity among the investor-owned electric utilities in terms of services, size, fuel usage, and prices charged. Most investor-owned electric utilities generate, transmit, and distribute electric power. Investor-owned electric utilities operate in all States except Nebraska; Hawaii is the only State in which all electricity is supplied by investor-owned electric utilities.

Data Users

The *Financial Statistics of Major U.S. Investor-Owned Electric Utilities* publication provides information about the financial results of operations of investor-owned electric utilities for use by government, industry, electric utilities, financial organizations and educational institutions in energy planning. In the private sector, the readers of this publication are researchers and analysts associated with the financial markets, the policymaking and decisionmaking members of electric utility companies, and economic development organizations. Other organizations that may be interested in the data presented in this publication include manufacturers of electric power equipment and marketing organizations. In the public sector, the readers of this publication include analysts, researchers, statisticians, and other professionals engaged in regulatory, policy, and program areas. These individuals are generally associated with the Congress, other legislative bodies, State public utility commissions, universities, and national strategic planning organizations.

Sources and Coverage

The source of financial information for the major investor-owned electric utilities is the Federal Energy Regulatory Commission (FERC) Form 1, "Annual Report of Major Electric Utilities, Licensees and Others," for calendar year 1993 and prior years. This survey is processed and published by EIA for the FERC. Major investor-owned electric utilities are defined as those investor-owned electric utilities that have had, in the past three consecutive calendar years, sales or transmission services that exceeded one or more of the following:

- 1 million megawatthours of total annual sales
- 100 megawatthours of annual sales for resale
- 500 megawatthours of annual power exchanges delivered
- 500 megawatthours of annual wheeling for others (deliveries plus losses).

The 1993 summary data are based on reports from 179 major investor-owned electric utilities. The FERC has also required seven independent power producers (Catalyst Old River Hydroelectric Limited Partnership; Entergy Power, Incorporated; Hardee Power Partners Limited; Nevada Sun-Peak Limited Partnership; Ocean State Power; Ocean State Power II; and Terra Comfort Corporation) to be under FERC jurisdiction and must submit the FERC Form 1 for 1993. The FERC has also determined that Golden Spread Electric Cooperative and Old Dominion Electric Cooperative should file a FERC Form 1 under Section 201 of the Federal Power Act. Detailed statistics for these seven independent power producers and two cooperatives are reported separately in Appendix C.

In 1991, Public Service Company of New Hampshire emerged from bankruptcy after an approved merger with Northeast Utilities. Due to fresh-start accounting, only data from May 16 through December 31 are included in the 1991 summary statistics. Pursuant to the reorganization plan resulting from the bankruptcy, the interest in the Seabrook plant was acquired on June 5, 1993, by North Atlantic Energy Corporation, also a subsidiary of Northeast Utilities. Both Public Service Company of New Hampshire and North Atlantic Energy Corporation submitted a separate FERC Form 1 for 1992 and 1993 and are thus included in both the summary and detailed statistics.

In 1993, Iowa Electric Light and Power Company and Iowa Southern Utilities Company merged into IES Utilities Incorporated.

Industry Profile

Selected electric utility data for 1993 are compiled from the Form EIA - 861, "Annual Electric Utility Report," for the the total universe of electric utilities. In 1993, there were 3,212 investor-owned, publicly owned, Federal, and cooperative electric utilities (Table 1). The 254 investor-owned electric utilities represent only 7.9 percent of the total number of electric utilities, but provide the majority of sales to ultimate consumers and sales for resale.

This publication presents data on the revenue and sales by type of electric utility as reported on the Form EIA-861. Average revenue per kilowatthour presented in this publication are calculated by dividing sales into revenue.

Key facts concerning sales and revenues in 1993 (Table 1) are as follows:

- The 254 investor-owned electric utilities (7.9 percent of all electric utilities) accounted for 79.0 percent of all revenues from sales of electricity to ultimate consumers and 42.6 percent of all revenues from sales for resale.
- The 2,007 publicly owned electric utilities (62.5 percent of all electric utilities) accounted for 12.5 percent of all revenues from sales to ultimate consumers and 18.2 percent of all revenues from sales for resale.
- The 10 Federal electric utilities accounted for 0.6 percent of all revenues from sales to ultimate consumers and 15.3 percent of all revenues from sales for resale.
- The 941 cooperative borrowers (29.3 percent of all electric utilities) accounted for 7.8 percent of all revenues from sales to ultimate consumers and 23.9 percent of all revenues from sales for resale.
- The average ultimate consumers revenue per kilowatthour ranged from 2.8 to 7.2 cents, depending on the type of electric utility. The overall average was 6.9 cents.
- The average sales for resale revenue per kilowatthour ranged from 3.3 to 4.1 cents, depending on the type of electric utility. The overall average was 3.6 cents.

Table 1. Selected Electric Utility Data by Ownership, 1993

Item	Type of Electric Utility				
	Investor-Owned	Publicly Owned	Federal	Cooperative	Total ¹
Number of Electric Utilities	254	2,007	10	941	3,212
Electric Utilities (percent)	7.9	62.5	*	29.3	100.0
Revenues from Sales to Ultimate Consumers (thousand dollars)	156,663,793	24,781,611	1,282,858	15,475,499	198,203,761
Revenues from Sales to Ultimate Consumers (percent)	79.0	12.5	.6	7.8	100.0
Sales of Electricity to Ultimate Consumers (thousand megawatthours)	2,186,888	406,976	46,369	221,030	2,861,265
Sales of Electricity to Ultimate Consumers (percent)	76.4	14.2	1.6	7.7	100.0
Average Revenue per kWh for Ultimate Consumers (cents)	7.2	6.1	2.8	7.0	6.9
Revenues from Sales for Resale (thousand dollars)	18,452,517	7,866,159	6,649,342	10,351,832	43,319,850
Revenues from Sales for Resale (percent)	42.6	18.2	15.3	23.9	100.0
Sales of Electricity Available for Resale (thousand megawatthours)	537,352	207,186	200,708	254,798	1,200,046
Sales of Electricity Available for Resale (percent)	44.8	17.3	16.7	21.2	100.0
Average Revenue per kWh for Sales for Resale (cents)	3.4	3.8	3.3	4.1	3.6

* Value less than 0.5 percent.

¹ Includes only those electric utilities in the United States and the District of Columbia.

Note: Totals may not equal sum of components because of independent rounding.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report." Data are based on calendar year submissions.

Selected operational data for 179 major investor-owned electric utilities are compared to the 254 investor-owned electric utilities in the United States that submit the Form EIA-861 (Table 2). In 1993, these investor-owned electric utilities (70.5 percent of the investor-owned electric utilities) accounted for 99.6 percent of the revenues from sales to ultimate consumers and 97.3 percent of the revenues from sales for resale of all investor-owned electric utilities.

All subsequent tables use the data reported on the FERC Form 1. Summary tables that contain historical data for 1989 through 1993 display aggregate financial statistics for investor-owned electric utilities classified as major for each year (Tables 3 and 5 through 30). Six tables contain ranking data on investor-owned electric utilities (Tables 31 through 36). Detailed data in State by electric utility sequence are also provided (Tables 37 through 46). For consistency, each investor-owned electric utility has been listed in the State where the corporate headquarters are located, rather than in the State where the majority of its sales occurred.

Data covering new plants that began commercial operation during the year are included (Table 4). Also, average power production expenses for plants owned by major investor-owned electric utilities for the last 5 years are shown (Table 14). These data were previously reported in *Electric Plant Cost and Power Production Expenses* (DOE/EIA-0455).

Deleted from the 1992 and 1993 publications are data covering transmission and distribution systems and expenditures for research, development, and demonstration. The transmission and distribution data will appear biennially in *Electric Trade in the United States* (DOE/EIA-0531), beginning with the 1992 publication.

Appendix A presents three tables containing the classification of investor-owned electric utilities. Table A1 lists the electric utilities added to and deleted from this publication for 1989 through 1993. Table A2 provides the "major" and "nonmajor" investor-owned electric utilities from 1989 through 1993. Table A3 indicates the holding company status under the Public Utility Holding Company Act of 1935.

Appendix B contains the bond ratings for major investor-owned electric utilities provided by Standard and Poor's. Table B1 is a summary of ratings for the years 1989 through 1993 and Table B2 lists the individual rating by major investor-owned electric utilities.

Appendix C contains 1993 detailed statistics covering the seven independent power producers and the two cooperatives jurisdictional to the Federal Regulatory Commission.

Appendix D contains the Technical Notes.

Table 2. Selected Data for Major U.S. Investor-Owned Electric Utilities Compared With All U.S. Investor-Owned Electric Utilities, 1993

Item	Investor-Owned
Number of Electric Utilities	¹ 179
Electric Utilities (percent)	70.5
Revenues from Sales to Ultimate Consumers (thousand dollars)	156,005,966
Revenues from Sales to Ultimate Consumers (percent)	99.6
Sales of Electricity to Ultimate Consumers (thousand megawatthours)	2,177,561
Sales of Electricity to Ultimate Consumers (percent)	99.6
Revenues from Sales for Resale (thousand dollars)	17,949,729
Revenues from Sales for Resale (percent)	97.3
Sales of Electricity Available for Resale (thousand megawatthours)	536,671
Sales of Electricity Available for Resale (percent)	99.9

¹ Excluded are the seven independent power producers and two cooperatives jurisdictional to the Federal Energy Regulatory Commission in 1993.
Note: Data are preliminary.

Company.*

Financial Performance

Overview

Highlights. Expanding sales and revenues were just sufficient to cover the increased costs prior to extraordinary items for the major investor-owned electric utilities in 1993. This occurred despite the cold first quarter, hot third quarter, and improving economy, all of which normally increase sales.

- Income before extraordinary items was up a scant \$0.1 billion. After adjusting for a swing of \$0.5 billion in extraordinary items, net income was down 2.7 percent to \$17.9 billion. However, earnings quality continued its trend towards improvement with allowance for funds used during construction (AFUDC) declining to 6.2 percent of the 1993 net income before extraordinary items.
- Electric utility operating revenues were up a respectable 4.1 percent to \$176.4 billion. Total electric operating expenses increased 5.1 percent to \$146.1 billion. The result was a decline of \$0.2 billion in net electric utility operating expenses, which ended the year at \$30.2 billion.
- Wholesale sales continued to contribute significantly to the total operating revenues, despite the reduction in average revenue per kilowatthour sold. The 6.4-percent increase in wholesale sales more than offset the 3.4-percent decline in average revenue, which resulted in a 2.8-percent increase in wholesale revenues. Wholesale revenues were \$17.9 billion, or 10.3 percent of total revenues from the sale of electricity.
- Common dividends were up 2.9 percent, resulting in an increase in the payout ratio to 95.1 percent.
- Significant changes in accounting practices and the creation of new regulatory accounts, instituted as a part of the accounting for pollution allowances, represented a major change on the balance sheets of many electric utilities. Additionally, 1993 was the first full year for the application of the revised accounting for income taxes required by Financial Accounting Standards Board (SFAS) No. 109. Absent the impacts of these changes in accounting practices, the electric utilities' balance sheets continued to show signs of modest growth. Total electric utility plant increased 3.6 percent, or \$18.5 billion, to \$537.3 billion. Net plant (after accumulated depreciation is deducted), exclusive of nuclear fuel investments, increased a more modest 1.5 percent to \$363.8 billion.
- The last investor-owned nuclear plant actively under construction went into commercial service in 1993. As such, 1993 should represent a watershed year for the industry in that, from 1994 forward, investments in nuclear power should decline sharply from the \$143.5 billion gross plant investment level as of December 31, 1993.
- Internally generated funds were sufficient to cover 93.2 percent of the investor-owned electric utilities' cash outflow for plant in 1993. In 1992, the ratio of internally generated funds to cash outflows for plant was only 81.5 percent. Cash outflows for plant were up 3.7 percent to \$28.3 billion in 1993.
- The electric power industry took advantage of the low interest rates that persisted through the first three quarters of 1993, to issue and retire more than \$54 billion of long-term debt. To place that figure in perspective, total outstanding long-term debt at the end of 1993 stood at \$174.9 billion. Therefore, in 1993, the industry refinanced about 31 percent of its outstanding debt.

Economic Context. Despite several positive factors that emerged during 1993, growth in the U.S. economy can only be characterized as slow for the better part of the year. Real Gross Domestic Product (GDP) was up 3.0 percent. However, the fourth quarter posted a 7.0-percent gain on an annualized basis, the highest quarterly increase in 6 years. A major factor in the increased GDP was the 4.2-percent increase in industrial production. The increased industrial activity did little to stimulate industrial sales of electricity which remained unchanged from the prior year. The improved economic activity, however, helped drive up commercial megawatthour sales 4.8 percent for the year.

Weather. Floods in the Midwest and a drought in the Southeast reduced the output of the agricultural sectors in these regions. However, the cleanup and construction activity that followed countered the reduction in agricultural output, suggesting that the economic effects of these regional weather events cannot be definitively assessed.

The weather improved retail electricity sales, which were up 3.5 percent, the largest increase since 1988 when sales were up 4.7 percent. Weather had its greatest effect on residential sales which were up 6.3 percent. The cold first quarter and hot third quarter increased heating degree days 12.3 percent and cooling degree days 23.1 percent from 1992, respectively.

Inflation and Interest Rates. Inflation continued under control in 1993, increasing a mere 2.5 percent for the

year, measured in terms of the GDP implicit deflator. The 1993 deflator increase was the smallest in 30 years (since 1964). The Consumer Price Index of all items (CPI-U) increased a mere 2.7 percent, the lowest increase since 1986. A major factor holding down the CPI-U was the decline in oil prices during the year. Oil prices at the beginning of the year averaged \$20 per barrel, as benchmarked by West Texas Intermediate crude oil. The \$20 price continued through the first half of the year before falling in mid-October to \$18.25 per barrel and dropping to \$14.25 per barrel by year-end. The 28.8-percent decline in oil prices translated directly into lower inflation.

Lower inflation generally leads to lower interest rates. Short-term interest rates as measured by the 3-month Treasury bills were the lowest in 30 years, averaging a mere 3.02 percent. Long-term interest rates were also at a 30-year low averaging 6.59 percent for the year (yields based on the most actively traded issues adjusted to 10-year constant maturities by the Treasury Department).

The low interest rates in 1993 resulted in the issuance and retirement of a record \$54.3 billion in long-term debt for the major investor-owned electric utilities. The 2-year historical low interest rates have resulted in over 50 percent of the outstanding long-term debt of the major investor-owned electric utilities being refinanced. Further, the last 5 years have seen the refinancing of about 80 percent of the electric utilities' long-term debt. Over the 5 years, the average interest rate has declined from 8.9 percent to 7.7 percent.

Income Statement

The Composite Statement of Income and Retained Earnings for major investor-owned electric utilities for the years 1989 through 1993 is presented in this publication (Table 6). Selected details for the gas and other utility operations of these companies are also included.

The Bottom Line. Earnings before extraordinary items were up only 0.5 percent in 1993, off significantly from the prior year's earnings which rose 8.3 percent before extraordinary items. After adjusting for a swing of \$0.5 billion in extraordinary items, net income of \$17.9 billion was down 2.7 percent when compared to 1992. Earnings quality continued to improve with allowance for funds used during construction (AFUDC) declining to 6.2 percent of 1993 income before extraordinary items (compared with 6.4 percent reported in 1992). Earnings quality has consistently improved over the 5-year period since 1989. Net other income and deductions of \$1.3 billion were down \$0.3 billion from the prior year. Common stock dividends were up 2.9 percent, rising to \$15.3 billion in 1993. (However, individual companies have begun reviewing their dividend policies in light of the emerging competitive pressure in the industry.) Preferred dividends reverted to the prior downward trend and decreased 13.4 percent to \$1.8 billion.

Revenues. Total electric operating revenues increased 4.1 percent, an increase of \$6.9 billion, to \$176.4 billion. Revenues from sales to ultimate consumers were up 5.2 percent, while revenues from sales for resale were up a more modest 2.8 percent. Wholesale customer revenues maintained over 10 percent of total revenues. Provisions for rate refunds exceeded \$1.4 billion, four times the prior year's value. Other operating revenues were \$3.8 billion, down 4.7 percent from \$4.0 billion.

Average revenues from sales to ultimate consumers were up 1.5 percent to 71.6 mills per kilowatthour. Total sales to ultimate consumers increased 3.5 percent. The increase in sales was held back by industrial sales that were virtually unchanged from the prior year. On the other hand, residential sales were up an unusually large 6.3 percent (aided by the weather changes), while commercial sales were up 4.8 percent. The increased retail sales contributed 68.9 percent of the \$7.6 billion increase in retail revenues, while the increase in average revenues contributed the remaining 31.1-percent increase.

Average revenues from wholesale sales continued a 3-year decline to 33.4 mills per kilowatthour, down from 34.6 mills per kilowatthour in 1992. As in prior years, this decline was more than offset by the 6.4-percent increase in wholesale sales. Wholesale volume increased slightly its percent share of total kilowatthour sales.

Operating Expenses. Total electric operating expenses increased 5.1 percent to \$146.1 billion in 1993. These expenses represented 82.9 percent of operating

revenues, up from 82.0 percent reported in 1992. The most significant increases in electric utility operating expenses between 1992 and 1993 were in the following categories:

- Operation expenses: up 4.6 percent, an increase of \$4.0 billion and contributing over half of the increase in total electric utility operating expenses.
- Federal income taxes: up 16.5 percent, an increase of \$1.0 billion and contributing 14.2 percent of the total increase.
- Depreciation expense: up 4.0 percent, an increase of \$0.6 billion and contributing 9.0 percent of the total increase.
- Regulatory debits and credits (new accounts): added \$0.7 billion in debits and \$0.2 billion in credits for a net contribution to the increase in total operating expenses of 6.1 percent.

Electric Operation and Maintenance Expenses. Electric operation and maintenance expenses were up 4.3 percent to \$103.8 billion in 1993. The increase in sales was insufficient to offset these increased costs. This resulted in a marginal increase in electric operation and maintenance expense per kilowatthour sold. The 1993 figure was 38.2 mills per kilowatthour versus 38.1 mills per kilowatthour in 1992. Electric operation expenses increased 4.6 percent (more than the 4.1 percent increase in kilowatthours sold), while maintenance expenses increased 2.1 percent. Operation expenses accounted for 33.6 mills per kilowatthour sold. Maintenance expenses accounted for 4.6 mills per kilowatthour sold.

Operation Expenses. Total electric operation expenses were \$91.3 billion in 1993, up 4.6 percent or \$4.0 billion. Power production expenses were up \$1.9 billion or 2.5 percent. Increases in fuel costs accounted for \$1.0 billion of this increase, while increased other power supply expenses accounted for \$0.7 billion. Of the \$27.7 billion in reported purchased power expenses in 1993, Southern California Edison Company and Pacific Gas & Electric Company represent \$2.5 billion and \$1.6 billion, respectively. Administration and general operation expenses were up \$1.7 billion. Increases in customer assistance expenses increased significantly by 25.2 percent, or \$0.3 billion.

Maintenance Expenses. Maintenance expenses were up a modest 2.1 percent for the year. Maintenance of power production facilities represented almost two-thirds of the total \$12.4 billion in maintenance expenses. Whereas nuclear and hydroelectric maintenance expenses each increased over 9 percent in the prior period, nuclear maintenance expenses were down 0.5 percent in 1993. Hydroelectric maintenance expenses were up a modest 0.9 percent. Maintenance of distribution plant accounted for \$3.3 billion of the total, or 26.7 percent.

Electric Operating Income. Net electric operating income of \$30.2 billion was down 0.8 percent for the year. The \$6.9 billion increase in electric operating revenues was more than offset by the increase in total electric operating expenses (up \$7.1 billion).

Interest Expenses. Interest expenses in 1993 of \$15.3 billion were \$0.5 billion lower than in 1992. Interest expenses associated with long-term debt (including amortization of debt discount, losses on reacquired debt, and related expenses) continued its decline from \$15.2 billion in 1990 to \$14.2 billion in 1993. This decline has occurred despite a \$6.9 billion increase in the associated long-term debt since 1990. The average interest rate declined from 9.2 percent in 1990 to 8.1 percent in 1993. These estimates are based on the average of the current and prior years' ending balances of long-term debt. Average outstanding long-term debt increased from \$173.0 billion in 1992 to \$174.5 billion in 1993, an increase of 0.9 percent. Average total debt, including notes payable, increased from \$180.9 billion to \$183.5 billion. The average embedded interest rate based on average outstanding total debt declined from 8.7 percent to 8.3 percent. The lower interest rates contributed to a \$0.6 billion reduction in interest expense, which was only partially offset by the \$0.1 billion increase in interest expense due to the higher levels of outstanding debt.

Interest coverage ratios improved slightly to 2.86 times with Allowance for Funds Used During Construction (AFUDC) and 2.78 times without AFUDC. Coverage ratios have consistently improved since 1990.

Other Income and Deductions. Miscellaneous nonoperating income of \$0.6 billion was half the prior year's value of \$1.2 billion. Miscellaneous nonoperating deductions increased \$1.1 billion to \$2.5 billion. The net result of the changes in nonoperating income and deductions was a \$1.7 billion reduction in its contribution to earnings. However, the impact of these

changes was offset to a large extent by the increase in the credit associated with deferred taxes. As such, the contribution of net other income and deductions was \$1.3 billion, down \$0.3 billion from the prior year's value of \$1.7 billion.

Earnings. Net income declined in 1993 by 2.7 percent to \$17.9 billion. The decline in net income was primarily due to extraordinary deductions of \$0.7 billion. (Texas Utilities Electric Company had a \$0.4 billion write-off because of regulatory disallowances on its Comanche Peak Unit 2 and Columbus Southern Power Company charged \$0.2 billion to this account because of regulatory disallowances on its Zimmer Plant.) The return on average common stock equity was also off slightly at 11.3 percent, down from 12.0 percent in 1992. The profit margin (net income as a percent of operating revenues) declined to 9.2 percent versus 9.9 percent in the proceeding year.

Dividends. Earnings available for common stock, after the payout to preferred and preference dividends, declined somewhat to \$16.1 billion in 1993. Preferred stock dividends declined 13.4 percent, reversing the upturn of the prior year. The preferred dividend as a percent of average outstanding preferred stock was 6.9 percent, substantially below the 8.1 percent of 1992. Common dividends declared continued to increase, albeit by a modest 2.9 percent. The average dividend rate on average common stock outstanding remained a constant 9.7 percent. It has held effectively at this level for the last 4 years. However, to maintain this dividend rate required the payout ratio to deteriorate somewhat from 91.1 percent in 1992 to 95.1 percent in 1993.

Table 3. Electric Operating Revenue and Net Electric Operating Income for Major U.S. Investor-Owned Electric Utilities, 1989-1993

Year	Electric Operating Revenues (thousand dollars)	Percent Change	Net Electric Operating Income (thousand dollars)	Percent Change
1989	150,903,317	¹ 4.8	20,351,256	² 2.7
1990	157,278,537	4.2	29,377,903	.1
1991	166,803,843	6.1	30,855,852	5.0
1992	169,488,035	1.6	30,478,942	-1.2
1993	176,354,365	4.1	30,236,352	-8

¹ Electric Operating Revenues were 143,930,420 thousand dollars in 1988.

² Net Electric Operating Income was 28,582,794 thousand dollars in 1988.

Note: Due to its emergence from bankruptcy, the 1991 financial statements for the Public Service Company of New Hampshire are from May 16 through December 31. Excluded are the independent power producers and cooperatives jurisdictional to the Federal Energy Regulatory Commission. Summary data are provided in Table 6.

Balance Sheet

Changes in the Composite Balance Sheet were dominated by changes in accounting for income taxes and regulatory actions by the creation of the new regulatory asset and liability accounts (Table 8).

Assets and Other Debits. Assets and other debits were up 11.9 percent, or \$60.3 billion, to \$566.6 billion in 1993. While in 1992 almost half of the \$18.8 billion increase in total assets and other debits came from net electric plant, the 1993 net plant changes only contributed 9.2 percent of the increase. Accounting changes resulted in the increase in assets and other debits to be more than three times their historical value.

In 1993, the FERC created new balance sheet accounts to address regulatory assets. These changes were instituted in conjunction with establishing the accounting framework that was to be used to reflect the Clean Air Act Amendments of 1990 (CAAA). In previous years, electric utilities generally recorded regulatory assets in the "other" deferred debits account. With the new account in place in 1993, many utilities restated the regulatory asset portion of their deferred debits in the new regulatory asset account along with the newly created regulatory assets in association with the CAAA.

In 1993, the new regulatory asset account had a recorded value of \$62.6 billion, a figure greater than the total change in assets and deferred debits. This increase was partially offset by the reduction in other deferred debits of \$20.6 billion, reflecting for the most part a reclassification of regulatory assets.

The other change in accounting now reflected in full on the electric utilities' balance sheets was that of the accounting for income taxes. For the last several years, under a series of Statement of Financial Accounting Standards (SFAS) released by the Financial Accounting Standard Board (FASB), the accounting for income taxes has been evolving. With the final release of SFAS No. 109, electric utilities were to utilize the new accounting for income taxes for fiscal years beginning after 1992. A few electric utilities anticipated the required accounting change and instituted this change in prior years. However, as is evident in the \$8.7 billion (69.1 percent) increase in accumulated deferred income taxes (asset), the major impact of this change in accounting was reflected in the 1993 filings. The change in accounting for income taxes is even more apparent in the deferred credits section of the balance sheet.

Despite the cloudy impact of the changes in accounting practices reflected in the 1993 filings, the electric utilities continued to see their investment base grow. Gross electric utility plant grew 4.2 percent over the prior year, an increase of \$21.1 billion. While distribution plant additions of \$8.8 billion were the largest category of expenditure, the placing in service of Comanche Peak Unit 2 by Texas Utilities Electric Company (the last investor-owned nuclear unit to

enter commercial service) helped raise the nuclear plant additions to \$7.1 billion (versus \$2.2 billion in 1992). In 1993, steam production plant additions were \$3.7 billion, transmission additions were \$2.3 billion and general plant additions were \$2.2 billion. These and other plant additions were offset by the \$3.8 billion in plant retirements in the year, with distribution plant and steam production plant representing the areas with the most significant plant retirements.

Electric construction work in progress (CWIP) dropped to \$18.0 billion, the lowest level since 1991. As a percent of net electric plant (including nuclear fuel but excluding CWIP), this ratio dropped to 5.1 percent, less than half of what it was in 1989.

Other property and investments increased 11.2 percent over the prior year, exceeding \$20.1 billion as of the end of calendar year 1993. The special funds account jumped 31.8 percent to \$7.1 billion in 1993, a \$1.7 billion increase. The \$0.3 billion decrease in other investments helped to counter the impact of the increase in special funds.

Current and accrued assets changed very little, down 2.4 percent from the 1992 ending balance, although individual items within the category changed.

In addition to the new regulatory accounts and the resulting reclassification of selected deferred debits discussed above, the most significant change in deferred debits can be found in the increase in the unamortized loss on reacquired debt account. The \$1.7 billion increase in this account (46.4 percent) was due to the continued long-term debt refinancings that occurred in 1993. In 1993, a record amount of electric utility long-term debt was retired due to a 30-year low in long-term interest rates.

Liabilities and Other Credits. While many electric utilities took advantage of the historically low interest rates to refinance their debt, they did not increase their use of debt in the overall capital mix. Long-term debt remains a relatively constant 48.5 percent of total capitalization (marginally down from 48.9 percent in 1992). Total capitalization of \$360.5 billion increased a modest 1.2 percent for the year, with proprietary capital increasing 2.0 percent and total long-term debt increasing 0.4 percent.

Preferred stock outstanding declined by 0.9 percent, resuming its general downward trend. The \$0.2 billion decline to \$25.3 billion outstanding at the end of 1993, reduced the preferred stock portion of total capitalization (including short-term debt) to 6.8 percent, down from 7.0 percent in 1992.

Changes in accounting for pensions and benefits resulted in a one-time increase of \$2.1 billion in this account. \$2.1 billion. Accumulated miscellaneous operating provisions increased \$0.9 billion or 75.5 percent. Over the last 2 years, this account has increased from \$0.8 billion to more than \$2.2 billion. The changes in these two accounts dominated the one-third increase in total other noncurrent liabilities outstanding at the end of 1993.

Short-term debt increased a modest 4.8 percent, from \$8.8 billion to \$9.2 billion in 1993. Current liabilities increased 7.3 percent, with the largest increase in the "other" current and accrued liabilities account.

As was the case with the asset and other debits side of the balance sheet, changes in accounting practices dominated the \$60.3 billion increase in total liabilities and other credits. Most of the change in total deferred credits between 1992 and 1993 was the result of newly created regulatory liabilities account and the revised calculation of accumulated deferred income taxes. Twelve electric utilities have recorded accumulated deferred income taxes in excess of \$2.0 billion. Commonwealth Edison Company, Southern California Edison Company, and Pacific Gas & Electric Company recorded the largest accumulated deferred income taxes of \$5.6 billion, \$4.7 billion, and \$4.5 billion, respectively. Changes of \$49.7 billion in total deferred credits included the \$15.1 billion of recorded regulatory liabilities and a \$39.9 billion increase in accumulated deferred income taxes. At least part of the regulatory liabilities account resulted from a reclassification of other deferred credits, which declined \$5.0 billion between 1992 and 1993, from \$16.0 billion to \$11.0 billion.

Cash Flow

Record levels of debt were issued and retired in 1993 according to the Composite Statement of Cash Flows (Table 10). Further, the changes in accounting practices also had a significant impact. Cash outflows for plant increased 3.7 percent, while aggregate cash flows from investment activities decreased 2.3 percent. Reflecting the significant impact of the major debt refinancings, net cash provided by financing activities increased 43.3 percent. Cash from operations increased 10.6 percent, aided largely by the more than doubling of the add-back associated with the noncash expense of deferred taxes. The net result was a decrease in net cash and cash equivalents of \$0.2 billion from 1992 to end the year at \$2.8 billion.

Cash Flows from Operating Activities. Net cash provided from operating activities of \$43.9 billion was up \$4.2 billion, or 10.6 percent. The big swing in cash from operations came from increases in other regulatory assets (negative \$18.6 billion), decreases in regulatory liabilities (\$6.6 billion) and "other" (up \$10.8 billion over the prior year). Depreciation and depletion increased \$0.9 billion to \$18.2 billion, while amortization increased a similar amount to \$4.0 billion. Reflecting the change in accounting for income taxes, deferred taxes of \$7.3 billion were up \$4.2 billion over the prior year's value.

Cash Flows From Investing. Cash flows associated with investments in construction and acquisition of plant were up \$1.0 billion to \$28.3 billion in 1993. As in 1992, the increase was primarily attributable to increased investment in utility plant. The only other investment activity worthy of special note was the

drop in investments and advances to subsidiary companies. In 1993, these investments dropped to \$0.1 billion, down approximately \$1.5 billion from the 1992 value.

Cash Flows From Financing. The low interest rates that continued throughout the first three quarters of 1993 resulted in a record amount of debt issuance and retirements. In 1993, \$54.4 billion of debt was retired and \$54.3 billion was issued. These figures represent over 30 percent of the \$174.9 billion of long-term debt outstanding as of the end of 1993. By refinancing this debt, the industry was able to reduce its average embedded interest rate at the end of the year from 8.2 percent to 7.7 percent. These record refinancings came on the heels of \$39.8 billion of debt issues and \$38.2 billion of debt retirements in 1992, the prior record levels.

While low interest rates were matched by investor interest in utility common equity investments, the interest in utility stocks began to wane towards the end of the third quarter when interest rates began to climb. Increased concern over future earnings in this industry in light of the growing competitive pressures led investors to shift out of electric utility stocks. While it is not clear that these factors were responsible for the decline in issuances of electric utility common equity in 1993, new common stock issuances of \$2.6 billion showed a \$1.7 billion drop over the previous year's \$4.4 billion.

At \$4.9 billion in 1993, the preferred stock issuances were up \$0.9 billion, but this was not sufficient to offset the \$1.7 billion increase in preferred stock retirements. Retirements of \$5.5 billion of preferred stock exceeded issuances by \$0.6 billion.

Electric Utility Consumers and Sales

Sales to ultimate consumers of 2,178 billion megawatthours in 1993 were up 3.5 percent from the prior year, continuing a steady increase. Cold first quarter and hot third quarter weather improved sales in the residential and commercial sectors considerably (which were up 6.3 percent and 4.8 percent, respectively). Commercial sales were also aided by the 3.0-percent (adjusted) increase in real gross domestic product for the year. However, despite the 4.1-percent increase in industrial production, electric sales to industry were virtually unchanged from the prior year.

The mix of sales to ultimate consumers reflected the uneven growth in sales patterns with residential and commercial sales gaining shares, while industrial sales lost ground. Residential and commercial sales were up to 32.8 percent and 30.0 percent, respectively, of total sales to ultimate consumers. In 1992, residential sales were 32.0 percent and commercial sales were 29.6 percent of total sales to ultimate consumers. Industrial

sales fell to 34.4 percent in 1993, down from 35.6 percent in 1992. Other sales remained at 2.8 percent of total sales to ultimate consumers, where it has stood for the last 3 years.

Average revenues (mills per kilowatthour) from ultimate consumers increased 1.1 mills or 1.5 percent to 71.6 mills per kilowatthour. This increase was a little larger than the 0.7-mill increase in 1992. Residential consumers saw the largest increase in average revenue of 1.6 percent or 1.4 mills to 87.7 mills per kilowatthour. The average revenue of 79.1 mills per kilowatthour generated by commercial consumers was up 0.7 mills or 0.9 percent. Industrial consumers saw a slight decline of 0.1 percent (less than 0.1 mill) to 49.7 mills per kilowatthour in average revenue. The increase in average revenue from the relatively insignificant "other" consumers (2.8 percent of total sales) was comparable to the increase experienced by residential consumers, i.e., 1.5 percent or 1.1 mills to 73.2 mills per kilowatthour.

Revenues from sales to ultimate consumers were up \$7.6 billion to \$156.0 billion in 1993. The combination of a 1.5-percent increase in average revenues and 3.5-percent increase in sales produced a 5.2-percent increase in total revenues from ultimate consumers. This was considerably better than the 1.0-percent increase in total revenues from ultimate consumers that occurred between 1991 and 1992. Residential consumers produced a \$4.7 billion increase in revenues from \$58.1 billion in 1992 to \$62.7 billion in 1993. Commercial consumers generated an additional \$2.8 billion in revenues, raising their total to \$51.6 billion. Recognizing the zero growth in sales and slight decrease in average revenue per kilowatthour sold, the industrial sector's revenues remained essentially unchanged at \$37.3 billion in 1993.

Of the \$8.1 billion increase in total revenues from sales of electricity, \$1.3 billion can be associated with the increase in average revenues while the remaining \$6.8 billion of the increase can be attributed to the increase in the volume of sales. For residential consumers, increased average revenues produced \$0.9 billion of the increase in revenues, while increased sales volume produced a \$3.7 billion advance. Using a similar breakdown, increased average revenues produced about \$0.5 billion and increased sales volume produced \$2.4 billion of the increase in commercial consumer revenues. Because both sales volume and average revenues remained essentially unchanged for the industrial sector, total revenues for this sector were unchanged.

From the perspective of the consumer, perhaps a more meaningful calculation is centered around the total bill paid. In 1993, the average revenue per residential consumer was up 6.7 percent to \$824 per consumer. In dollar terms, the increase in total dollars paid per residential consumer was \$52. Commercial consumers paid 4.5-percent higher total bills or \$232 more per consumer. Industrial average consumer bills increased a marginal 0.4 percent, totalling \$360 for the year.

Emerging Factors

A number of factors have emerged during the 1990's in the business environment of the electric utility industry. Perhaps the most widely discussed was the passage of the Clean Air Act Amendments (CAAA) of 1990. While not having an immediate impact on the financial operations of the electric utilities, the passage of this act will result in the potential for significant incremental investments in pollution control equipment (e.g., SOx scrubbers), the potential shifting from high sulfur coal to lower sulfur coal where feasible to achieve the emissions standards, the potential shift to a greater utilization of natural gas as a generating fuel and the emergence of a market for the trading of emission allowances. Implementation is to be done in two phases. Phase I is directed at certain large electric utility units (greater than 100 megawatts), in order to reduce their sulfur dioxide emissions below 2.5 lbs per million Btu during the years 1995 to 2000. Phase II, which begins January 1, 2000, expands the program to include most electric utility units that emit sulfur dioxide. Phase II sulfur dioxide emission limits vary depending on different characteristics of the units, but most limitations are established around a goal of being at or below 1.2 lbs per million Btu. As the industry attempts to respond to the provisions of the CAAA, the impact on the financial performance and relative competitiveness of electric power will become more evident.

The U.S. Environmental Protection Agency implemented a program of sulfur dioxide emission allowance trading as part of the Acid Rain Program authorized by the CAAA. Electric utilities may use allowance trading as part of their compliance strategy to meet sulfur dioxide emission reduction deadlines. While there has been a substantial amount of interest in the allowance trading option, relatively few trades have been made. The allowance prices have been low (\$175 to \$350 apiece).

The Allowance Trading System maintained by the U.S. Environmental Protection Agency indicates the following major private allowance trades in 1992:

- Duquesne Light Company (PA) purchased 25,000 allowances (15,000 Phase I with an option on 10,000 more) from Wisconsin Power and Light Company (WI).
- Ohio Edison Company (OH) purchased 25,000 allowances from Alcoa Generating Corporation (IN).
- Tennessee Valley Authority (TN) purchased 10,000 allowances from Wisconsin Power and Light Company (WI).

The allowance trades announced in 1993 were:

- Carolina Power and Light Company (NC) purchased 150,000 allowances from Big Rivers Electric Corporation (KY) and Henderson City Commission (KY).

- Illinois Power Company (IL) purchased 125,000 allowance options from an unknown seller.
- Illinois Power Company (IL) purchased 90,000 allowances from Southern Indiana Gas and Electric Company (IN).
- Illinois Power Company (IL) purchased 80,000 allowances from Central Illinois Public Service Company (IL).
- Illinois Power Company (IL) purchased 75,000 allowances from Wisconsin Electric Power Company (WI).
- Wisconsin Electric Power Company (WI) purchased 75,000 allowances from Illinois Power Company (IL).
- Wisconsin Electric Power Company (WI) purchased 50,000 allowances from United Illuminating Company (CT).
- PSI Energy Incorporated (IN) purchased 37,000 allowances from Wisconsin Electric Power Company (WI).
- Illinois Power Company (IL) purchased 35,000 allowances from PacifiCorp (OR).
- AMAX Energy (IN) purchased 30,000 allowances from Long Island Lighting Company (NY).
- American Lung Association (NY) obtained by donation 10,000 allowances from Northeast Utilities (CT).
- Illinois Power Company (IL) purchased 6,000 - 8,000 allowances from New York State Electric and Gas Company (NY).
- AMP-Ohio (OH) purchased 4,384 allowances from Big Rivers Electric Corporation (KY) and Henderson City Commission (KY).

The Federal Energy Regulatory Commission (FERC) has begun a number of initiatives that could eventually result in a more competitive electric power industry, as demonstrated by its adoption of rates on some power sales that were arrived at through competitive bidding, compared with the traditional cost-of-service approach. Many States have also adopted competitive procurement as a mechanism to encourage alternative power sources rather than con-

tinue with cost-of-service regulation. Some States are going even further and requiring demand-side management (DSM) and conservation measures to be included along with the alternative power supply options being considered by electric utilities. Congress passed the Public Utility Regulatory Policies Act of 1978 that would require States to consider least-cost planning to promote DSM and energy conservation strategies. As this trend moves towards more innovative supply/demand planning and pricing of electric power unfolds, it could have a significant impact on the financial operations of electric utilities, particularly those with relatively high cost per kilowatt of installed capacity.

The most significant legislation passed in 1992, that will have an immediate impact on the electric power industry, was the Energy Policy Act of 1992. This act contains many provisions that significantly will impact this industry and eventually will be reflected in the financial data included in this publication. Among the many issues addressed are the following:

- Transmission access/regional transmission groups
- Global warming (greenhouse gases)
- Foreign utility ownership
- Enrichment facility cleanup/utility assessments
- Nuclear energy initiatives
- Public Utility Holding Company Act reform/Exempt Wholesale Generator investments (filing requirements)

The FERC issued new accounting rules for the investor-owned electric utilities on March 31, 1993. It is the final order codifying a Notice of Proposed Rulemaking (NOPR) to amend the Uniform Systems of Accounts for public utilities, licensees and natural gas companies under Title IV of the Clean Air Act of 1990, as amended. It adopts accounting requirements for allowances for emissions of sulfur dioxide to be bought, sold, or traded. The FERC made a point in the order to state that the rule is "rate neutral" because the prescribed accounting will reflect the economic effects of whatever ratemaking treatment is granted and does not favor one rate treatment over another.

New Plants

For 1993, eighteen electric plants were placed in commercial service by investor-owned electric utilities

(Table 4). The last investor-owned nuclear plant, Comanche Peak 2, went into commerce service on August 3, 1993.

Environmental Protection

On December 2, 1975, the FERC issued Order No. 542, which established the reporting of capital costs and annual expenses for operating environmental protection facilities and activities.

Investments in environmental protection facilities applicable to electric utility plant increased by \$2.2 billion to \$60.3 billion in 1993. By the end of 1993, this represented 11.5 percent of the investment in electric utility plant. In addition, \$3.7 billion of environ-

mental protection facilities construction work in progress was included in electric utility plant and represented 20.2 percent of the electric utility plant construction work in progress (Table 5). Detailed information on environmental protection facilities indicates that air pollution control investments accounted for \$25.1 billion of the \$60.3 billion invested in environmental protection (Table 45).

In 1993, the major investor-owned electric utilities recorded operating expenses of \$3.6 billion related to environmental protection facilities. This represented 4.0 percent of total electric operating expenses (Table 46).

Table 5. Investments in Environmental Protection and Construction Work in Progress for Major U.S. Investor-Owned Electric Utilities on December 31, 1989-1993

Year	Environmental Investments (thousand dollars)	Electric Utility Plant ¹ (thousand dollars)	Percent of Electric Utility Plant	Environmental CWIP (thousand dollars)	Electric Utility CWIP ² (thousand dollars)	Percent of Electric Utility CWIP
1989	49,370,594	428,700,561	11.5	4,454,276	33,714,555	13.2
1990	55,644,943	458,081,342	12.1	3,096,321	22,558,726	13.7
1991	58,016,486	479,822,229	12.1	2,502,552	18,077,211	13.8
1992	58,102,361	498,118,599	11.7	3,490,260	20,648,234	16.9
1993	60,317,871	519,207,367	11.6	3,614,232	18,048,849	20.0

¹ Excludes cost of nuclear fuel.

² Excludes other utility plant CWIP.

Note: Due to its emergence from bankruptcy, the 1991 financial statements for the Public Service Company of New Hampshire are from May 16 through December 31. Excluded are the independent power producers and cooperatives jurisdictional to the Federal Energy Regulatory Commission. Summary data are provided in Table 8 and detail data in Table 45.

R = Revised data. See Technical Notes Table D1.

* PacifiCorp took a \$587.9 million loss in this account.

Note: Totals may not equal sum of components because of independent rounding. Detail data are provided in Table 37. Due to its emergence from bankruptcy, the 1991 financial statements for the Public Service Company of New Hampshire are from May 16 through December 31. Excluded are the independent power producers and cooperatives jurisdictional to the Federal Energy Regulatory Commission.

Note: Totals may not equal sum of components because of independent rounding. Detail data are provided in Table 39. Due to its emergence from bankruptcy, the 1991 financial statements for the Public Service Company of New Hampshire are from May 16 through December 31. Excluded are the independent power producers and cooperatives jurisdictional to the Federal Energy Regulatory Commission.

Table 11. Electric Operation and Maintenance Expenses for Major U.S. Investor-Owned Electric Utilities, 1989-1993 (Continued)
(Thousand Dollars)

Item	1993	1992	1991	1990	1989
Sales Expenses					
Supervision	27,155	23,620	24,239	23,213	24,062
Demonstrating and Selling Expenses	123,124	120,627	113,456	123,168	118,996
Advertising Expenses	17,045	19,614	20,483	28,369	31,401
Miscellaneous Sales Expenses	35,967	34,786	45,053	37,484	34,195
Total Sales Expenses	203,291	198,647	203,230	212,233	208,655
Administrative and General Expenses					
Operation Expenses					
Administrative and General Salaries	3,049,587	2,899,916	2,767,379	2,723,577	2,511,485
Office Supplies and Expenses	1,419,829	1,362,606	1,365,296	1,293,454	1,166,659
(less) Administrative Expenses					
Transferred (credit)	382,939	368,353	357,776	348,960	312,018
Outside Services Employed	1,046,162	979,922	985,932	890,416	756,540
Property Insurance	484,510	470,929	479,444	503,111	528,754
Injuries and Damages	868,713	820,673	766,207	787,732	721,772
Employee Pensions and Benefits	4,627,862	3,492,234	3,344,941	2,924,205	2,548,579
Franchise Requirements	297,805	279,022	265,953	251,935	227,431
Regulatory Commission Expenses	343,719	327,141	322,476	315,916	260,654
(less) Duplicate Charges (credit)	275,150	232,344	192,527	197,050	186,466
General Advertising Expenses	50,710	47,079	51,408	55,921	53,953
Miscellaneous General Expenses	1,206,736	961,507	1,059,616	833,717	897,799
Rents	386,757	368,243	338,140	337,220	371,641
Total Operation Expenses	13,124,300	11,408,575	11,196,490	10,371,195	9,546,783
Maintenance of General Plant	373,233	357,752	346,197	330,388	309,592
Total Administrative and General Expenses	13,497,534	11,766,327	11,542,687	10,701,583	9,856,375
Total Electric Operation and Maintenance Expenses	103,775,143	99,466,938	97,958,171	92,865,977	87,722,756
Distribution of Salaries and Wages Charged to Electric Operation and Maintenance					
Production	6,470,406	6,070,543	6,210,064	5,990,703	5,754,165
Transmission	591,091	564,844	581,234	570,024	555,592
Distribution	2,880,939	2,712,704	2,765,725	2,661,582	2,634,407
Customer Accounts	1,672,704	1,606,362	1,588,841	1,542,789	1,505,837
Customer Service and Informational Expenses	481,631	414,655	413,890	385,871	361,424
Sales Expenses	90,629	92,571	94,619	92,901	96,397
Administrative and General	2,968,581	2,771,709	2,713,028	2,658,147	2,530,457
Allocated from Clearing Accounts	1,576,464	1,575,861	1,559,857	1,447,489	1,422,958
Total Salaries and Wages	16,732,445	15,809,250	15,927,258	15,349,506	14,861,236
Number of Electric Department Employees					
Regular Full-time Employees	446,901	466,253	482,127	484,651	475,066
Part-time and Temporary Employees	11,172	14,752	15,003	16,758	19,837
Total Electric Department Employees	458,073	481,005	497,130	501,409	494,903

Note: Operating expenses include fuel expenditures. Totals may not equal sum of components because of independent rounding. Detail data are provided in Table 41. Due to its emergence from bankruptcy, the 1991 financial statements for the Public Service Company of New Hampshire financial statements for 1991 are from May 16 through December 31. Excluded are the independent power producers and cooperatives jurisdictional to the Federal Energy Regulatory Commission.

R = Revised data. See Technical Notes Table D2.

Note: Totals may not equal sum of components because of independent rounding. Detail data are provided in Table 42. Due to its emergence from bankruptcy, the 1991 financial statements for the Public Service Company of New Hampshire are from May 16 through December 31. Excluded are the independent power producers and cooperatives jurisdictional to the Federal Energy Regulatory Commission.

Total Energy Losses	159,759	155,251	152,621	148,549	159,774
Total Sales and Disposition	2,881,186	2,769,964	2,744,250	2,602,578	2,562,732

¹ Data reporting initiated in 1990.

² Data prior to 1990 were reported as Sales for Resale (one entry) which is shown as Requirements for Resale for the year 1989.

NA = Not available.

Note: Totals may not equal sum of components because of independent rounding. Double counting occurs in components of both sources and disposition of energy and thus neither provides a true total. Purchases from utilities, net interchanges, and net wheeling (except for imports) are included in net generation. Sales for resale is included in sales to ultimate consumers. Detail data are provided in Table 43. Due to its emergence from bankruptcy, the 1991 financial statements for the Public Service Company of New Hampshire are from May 16 through December 31; the January 1 through May 15, 1991 data values are 2,374 thousand megawatthours for sales to ultimate consumers and 1,765 thousand megawatthours (234 for requirements and 1,531 for non-requirements) for sales for resale with 4,420 thousand megawatthours for total sales and disposition. Excluded are the independent power producers and cooperatives jurisdictional to the Federal Energy Regulatory Commission.

Energy Used by Company (exc station use)	3,824	22,108	0	979	0	114,576
Total Energy Losses	131,738	141,524	0	42,525	13,883	1,514,831
Total Sales and Disposition	1,936,440	10,061,588	426,161	720,330	5,739,866	32,550,344

Note: Totals may not equal sum of components because of independent rounding. Double counting occurs in components of both sources and disposition of energy and thus neither provides a true total. Purchases from utilities, net interchanges, and net wheeling (except for imports) are included in net generation. Sales for resale is included in sales to ultimate consumers. Summary data are provided in Table 30.

Total Energy Losses	14,975	1,445,423	565,313	597,659	3,299
Total Sales and Disposition	552,218	27,204,067	10,926,751	10,772,136	246,893

Note: Totals may not equal sum of components because of independent rounding. Double counting occurs in components of both sources and disposition of energy and thus neither provides a true total. Purchases from utilities, net interchanges, and net wheeling (except for imports) are included in net generation. Sales for resale is included in sales to ultimate consumers. Summary data are provided in Table 30.

Selected Financial Indicators

Capitalization Ratios

Capitalization ratios show how capital structure is proportioned. The capitalization ratio measures the volume of capital contributed by stockholders in relationship to that advanced by bond and note holders. The short-term notes have been included as a portion of capitalization due to their wide use in financing in recent years. Short-term notes payable include the face value of all notes, drafts, and acceptances, well as other similar evidence of indebtedness payable on demand, or within a time not exceeding 1 year from date of issue to those other than associated companies. The ratios are based on year-end balances.

Common Equity (Percent of Total Capitalization)

This common equity percent of total capitalization is based on the average of the beginning- and the end-of-the-year balances, and excludes short-term debt (notes payable) in the computation. This differs from the common equity shown in column 1 of the selected financial indicators table.

Rate of Return on Common Equity

The computed rates of return on common stock (common equity) for the major investor-owned electric utilities are presented. For some of the calculations not shown, the omitted electric utility essentially functions as an operating department of another company (its return was not meaningful). For other companies the ratio is not shown because they are in a net-loss position.

The computed rate of return is the relationship of total earnings available for common stock to the average of the beginning- and year-end balances for proprietary capital, less preferred stock.

The presentation of the rates of return on common equity is not intended as an evaluation of the reasonableness for returns under the applicable regulatory standards.

Utility Operating Revenues / Total Assets and Other Debits

This ratio measures the productivity of assets. As the ratio increases, it indicates that the assets have become more productive and are generating more revenues. This ratio is calculated by dividing utility operating revenues, as reported in Table 37 of this publication, by total assets and other debits, as reported in Table 38.

Interest Coverage

The number of times that fixed interest charges are earned (covered) is an indication of the margin of safety for interest on fixed debt. The times-interest-earned ratios are calculated by using net earnings before taxes (Federal and other) on two different bases: with allowance for funds used during construction and without allowance for funds used during construction. In Table 44 these ratios of measurement have been omitted for electric utilities that either have no significant outstanding long-term debt or short-term notes payable, or are subsidiary companies that receive interest-free financing from the parent, and therefore, have no significant interest charges.

¹ Excluded is Northeast Nuclear Energy Co whose data were not included to prevent double-counting of data for the Millstone Nuclear Plant which Northeast Nuclear Energy Co operates for Connecticut Light & Power Co and Western Massachusetts Elec Co. Also excluded is Golden Spread Electric Cooperative whose data were not included since they are classified as a cooperative on the Form EIA-861; however, the Federal Energy Regulatory Commission (FERC) has determined that Golden Spread Electric Cooperative should file a FERC Form 1 under Section 201 of the Federal Power Act.

² Excluded is Golden Spread Electric Cooperative whose data were not included since they are classified as a cooperative on the Form EIA-861; however, the FERC has determined that Golden Spread Electric Cooperative should file a FERC Form 1 under Section 201 of the Federal Power Act.

³ Excluded are Golden Spread Electric Cooperative and five independent power producers jurisdictional to the FERC in 1991. The independent power producers are Catalyst Old River Hydroelectric Limited Partnership, Entergy Power Inc, Nevada Sun-Peak Limited Partnership, Ocean State Power, and Terra Comfort Corporation.

⁴ Excluded are Golden Spread Electric Cooperative, Old Dominion Electric Cooperative, and six independent power producers jurisdictional to the FERC in 1992. The independent power producers are Catalyst Old River Hydroelectric Limited Partnership, Entergy Power Inc, Nevada Sun-Peak Limited Partnership, Ocean State Power, Ocean State Power II, and Terra Comfort Corporation.

⁵ Excluded are Golden Spread Electric Cooperative, Old Dominion Electric Cooperative, and seven independent power producers jurisdictional to the FERC in 1993. The independent power producers are Catalyst Old River Hydroelectric Limited Partnership, Entergy Power Inc, Hardee Power Partners Limited, Nevada Sun-Peak Limited Partnership, Ocean State Power, Ocean State Power II, and Terra Comfort Corporation.

¹³ Effective the reporting year 1992, the company name changed from Vermont Marble Co.

¹⁴ Effective the reporting year 1992, the company name changed from Kansas Power & Light Co.

Note: Identifying the classifications for privately owned electric utilities as follows:

M = Major

NM = Nonmajor

- = Unclassified

. = Not in existence

** = Exempted, determined by FERC

Source: Federal Energy Regulatory Commission, FERC Form 1, "Annual Report of Major Electric Utilities, Licensees and Others" and FERC Form 1F, "Annual Report of Nonmajor Public Utilities and Licensees."

Holding Companies of Major U.S. Investor-Owned Electric Utilities

The current ownership structure of the investor-owned segment of the electric utility industry is largely a function of the passage and implementation of the Public Utility Holding Company Act of 1935 (PUHCA). Prior to the passage of this act, the industry had evolved into a complicated intertwined network of subsidiary companies controlled by a few large holding companies. The persons controlling the parent holding companies used this structural mechanism to circumvent both State and Federal regulations. Congress passed PUHCA because it felt that holding companies exerted undue control over supposedly regulated activities and extracted profits from the operating companies. As a result of the passage and implementation of PUHCA, the current structure of the investor-owned segment has the following characteristics:

- Registered holding companies¹ which are substantially restricted to owning subsidiary companies whose purpose tends towards the "economical and efficient development of an integrated public-utility system" and such companies are a part of a single integrated public-utility system
- Requiring the separation of electric and gas operations unless it can be shown that there are substantial economies of joint operation
- Preventing the ownership by a utility of any non-utility enterprise unless that enterprise was (a) reasonably incidental, or economically necessary or appropriate to the operations of an integrated utility system (or in the public interest)
- Exempting holding companies from most of the provisions of PUHCA provided: 1) company business is conducted primarily within the borders of a single State, or 2) the holding company is a public utility operating within the State in which it is organized or within contiguous States.

UNITIL Corporation became a registered electric utility holding company on April 28, 1992, when it acquired Fitchburg Gas and Electric Light Company. It is the first registered holding company that the Securities and Exchange Commission has established in over 25 years. The electric utility companies owned

by UNITIL Corporation are Concord Electric Company (NH), Exeter and Hampton Electric Company (NH), Fitchburg Gas and Electric Light Company (MA), and UNITIL Power Corporation (NH).

Only 11 entities at present are registered electric utility holding companies. They are Allegheny Power System Inc, American Electric Power Company Inc, Central and South West Corporation, Eastern Utilities Associates, Entergy Corporation, General Public Utilities Corporation, New England Electric System, Northeast Utilities, Philadelphia Electric Power Company (owner of Susquehanna Power Company that generates power from Conowingo Dam located on the border of the States of Maryland and Pennsylvania), The Southern Company, and UNITIL Corporation. However, a significant majority of the rest of the investor-owned electric utilities have applied for exempt holding company status under PUHCA. Additionally, three entities (Columbia Gas System Inc, Consolidated Natural Gas Company, and Natural Fuel Gas Company) are registered gas utility holding companies. Table A3 provides a listing of the major investor-owned electric utilities and their associated holding company, if applicable.

The increase in applications for exempt holding company status is an outgrowth of the winding down in electric utility capital expenditures associated with a generating plant, the increase in internally generated cash flows in excess of dividend requirements, and the desire of many electric utility executives and board of directors to look to diversify in nonutility investments as a mechanism to stabilize and improve shareholder values. PUHCA restricts investor-owned electric utilities from competing outside their service territories and imposes the stringent regulation as "electric utilities" on those nonutilities interested in entering the wholesale electric power business. The PUHCA reform legislation (Energy Policy Act of 1992) passed by the 102nd Congress focuses on introducing a new form of independent power producer called an "exempt wholesale generator" which would be exempt from the restrictions of PUHCA. The motivation behind supporters of this legislation is to increase baseload generating capacity without providers being considered "electric utilities" or limited to the single-integrated system constraints.

¹ According to the Public Utility Holding Company of 1935(Act), "holding company" means...

(A) any company which directly or indirectly owns, controls, or holds with power to vote, 10 percent or more of the outstanding securities of a public-utility company or a company which is a holding company by virtue of this clause or clause (B), unless the Commission (i.e., the SEC), as within the Act provides by order or decree such company not to be holding company; and (B) any person which the Commission determines or indirectly to exercise such controlling influence over the management or policies of any public-utility or holding company as to make it necessary or appropriate in the public interest to be subject to the obligations, duties and liabilities imposed in the Act upon holding companies.

Also, the Act defines a public-utility company to mean an electric utility company or a gas utility company. Further, it defines an electric utility company as any company which owns or operates facilities used for the generation, transmission, or distribution of electric energy for sale, other than sale to tenants or employees of the company operating such facilities for their own use and not for resale. The Commission may declare a company owning and operating any such facilities not to be an electric utility if the Commission finds that:

(A) such company is primarily engaged in one or more business other than the business of an electric utility company and by reason of the small amount of electric energy sold by such company, it is not in the public interest to be considered an electric utility company for purposes of the Act, or (B) such company is one operating within a single State and substantially all of its securities are owned directly or indirectly by another company to which such operating company sells or furnishes electric energy which it generates and such other company uses and does not resell such electric energy and, further is engaged primarily in manufacturing and is not controlled by any other company; and by reason of the small amount of electric energy sold or furnished by such operating company to other persons it is not in the public interest to be considered an electric utility company for purposes of the Act.

**Table A3. Major U.S. Investor-Owned Electric Utilities with Holding Company
Status Under the Public Utility Holding Company Act of 1935**

Operating Company	State	Holding Company	Status

Appendix B

Bond Ratings for Major U.S. Investor-Owned Electric Utilities

Appendix B

Bond Ratings for Major U.S. Investor-Owned Electric Utilities

Appendix B provides the Standard & Poor's (S&P) bond ratings for 1989 through 1993, for the investor-owned electric utilities that file the FERC Form 1. The bond ratings reflect the evaluation of independent specialists on the ability of the electric utility to pay interest and principal on its bonds. The assessments consider the electric utility's operating efficiency, fuel/power supply, regulation, management, competition, long-term demand, construction, earnings, debt, cash flow, financial flexibility, and accounting quality.

As rated by S&P, the bond ratings of the individual electric utilities range from AAA to D. The notation of '+' or '-' indicates a strong or weak assessment of the rating. The AAA is the highest rating assigned by S&P to a debt obligation and indicates an extremely strong capacity to pay principal and interest. Bonds rated AA qualify as high quality debt obligations and mean that the ability of the electric utility to pay interest is very strong. In general, AA bonds differ from AAA issues only in small degrees. Bonds rated A are issued to electric utilities with a strong ability to pay principal and interest, but are judged somewhat more susceptible to the adverse effects of changes in economic conditions. The BBB rated bonds reflect an adequate ability to pay principal and interest. Although bonds in the B category normally exhibit adequate risk protection, adverse economic conditions or changing circumstances are more likely to weaken the ability of the electric utility to pay principal and interest when its bonds are rated as a B category rather than an A category. The BB and B rated bonds are regarded as predominantly speculative with respect to the ability of the issuer to meet the terms of the obligation. The various C categories are regarded by the investment community as very speculative and would not be fit for sale to institutional investors. They indicate inadequate risk protection with adverse economic changes or changing circumstances weakening the ability to pay principle and interest. The rating of D indicates default on the payment on its bonds.

The bond rating is a valuable tool for gauging the financial prospects of an industry. Overall, corporate bond ratings indicate credit strength, the ability to

attract debt-financed capital, solvency, and the ability to repay creditors. Specifically, the ratings provide a way of estimating financial prospects for a utility on long-term debt issues (15 to 30 years) and are made against the backdrop of economic, financial, social, and political trends affecting an industry. Future economic conditions are considered, for example, as part of the assessment process for each individual company, as well as specific factors, such as earnings, electricity demand, and construction. Further, the electric utilities are evaluated on their financial prospects considering past performance, present problems and how they plan to deal with their problems.

This publication contains 179 investor-owned electric utilities jurisdictional to the Federal Energy Regulatory Commission. However, the bond ratings for the 178 investor-owned electric utilities that filed the FERC Form 1 for the last two years were compared for 1992 and 1993. The results of the comparison were divided into six categories: no change in bond rating, bond rating given in 1993, no new bonds issued, bond rating decreased, bond rating improved, and no bond rating was issued. These data, with an S&P rating, showed that 108 electric utilities (60 percent) had no change in bond ratings, 1 electric utility (less than 1 percent) given a rating, 16 electric utilities (9 percent) were not given ratings by S&P, 29 electric utilities (16 percent) had issued no bonds, 18 electric utilities (10 percent) had a decrease in their bond rating from 1992 to 1993, and 7 electric utilities (4 percent) had an improvement in their bond rating from the previous year. The bond ratings were further compared for trends. From 1989 to 1993, lower bond ratings occurred for 37 electric utilities while 32 electric utilities had higher bond ratings. In 1989, 28 electric utilities had a bond rating of AA, compared with 26 electric utilities in 1993. The number of electric utilities with a bond rating of A increased from 54 in 1989 to 57 in 1993. The number of electric utilities with a bond rating of BBB decreased from 47 in 1989 to 43 in 1993. The number of ratings below BBB- remained unchanged. Note that on January 8, 1992, the El Paso Electric Company filed a petition for reorganization under chapter 11 of the United States Bankruptcy Code.

**Table B1. Summary of Bond Ratings for Major U.S. Investor-Owned Electric Utilities on
December 31, 1989-1993**

Ratings	1993	1992	1991	1990	1989
AAA+ to AAA-	1	1	1	1	1
AA+ to AA-	26	29	31	31	28
A+ to A-	57	53	51	49	54
BBB+ to BBB-	43	48	51	51	47
Below BBB-	7	3	3	5	7
Total Rated	134	134	137	137	137
No Bonds	29	30	31	30	30
No Rating	16	16	15	15	15
Total Majors	¹ 179	² 180	³ 183	⁴ 182	⁵ 182
Number Improved	7	24	12	19	19
Number Declined	18	9	14	13	23

¹ Iowa Electric Light & Power Co and Iowa Southern Utilities Co merged into IES Utilities Inc.

² Fale-Safe Inc, UGI Corp, Warm Springs Power Enterprises, and Yankee Atomic Electric Co were exempt by the FERC. Centel Corp was acquired by UtiliCorp United Inc; Iowa Power Inc and Iowa Public Service Co merged into Midwest Power Systems Inc; Kansas Power and Light Co was acquired by Western Resources Inc; and Michigan Power Co merged into Indiana Michigan Power Co. Great Bay Power Corp, Kanawha Valley Power Co, North Atlantic Energy Corp, and Pioneer Power and Light Co were not major investor-owned electric utilities prior to 1992.

³ Vermont Electric Transmission Co Inc was not a major investor-owned electric utility prior to 1991.

⁴ James River-NH Electric Inc was exempt by the FERC. Ohio Valley Transmission Co merged into Louisville Gas & Electric Co. New England Hydro-Transmission Corp and New England Hydro-Transmission Elec Co Inc were not major investor-owned electric utilities prior to 1990.

⁵ Pacific Power & Light Co and Utah Power & Light Co merged into the PacifiCorp. Fale Safe Inc, Long Sault Inc, New England Electric Transmission Corp, and Rockland Electric Co were not major investor-owned electric utilities prior to 1989.

Note: Data provided for respondents to Federal Energy Regulatory Commission, FERC Form 1, "Annual Report of Major Electric Utilities, Licensees and Others."

Appendix C

**Other U.S.
Entities
Jurisdictional
to the FERC**

Appendix C

Other U.S. Entities Jurisdictional to the FERC

Appendix C provides a group of entities that are being segregated from the investor-owned electric utility data because of their unique status. This group consists of six independent power producers and two generation and transmission cooperatives whose operating revenues come under the jurisdiction of the Federal Energy Regulatory Commission (FERC). Thus, each entity filed a FERC Form 1 in 1992.

Catalyst Old River Hydroelectric Limited Partnership runs a 192 MW hydroelectric project (Sidney A. Murray Hydroelectric Station) built at Vidalia, Louisiana, on the Mississippi River. The project's power is sold to Louisiana Power and Light Company and the town of Vidalia, Louisiana. Entergy Power Incorporated purchased 265 MW or 31.5 percent undivided ownership interest in the 842 MW lignite coal-fired plant (Independence 2) located near Newark, Arkansas, and the 544 MW oil- and gas-fired plant (Robert Ritchie 2) located near Helena, Arkansas, from Arkansas Power and Light Company. Entergy Power Incorporated is marketing this capacity in the wholesale arena. Nevada Sun-Peak Limited Partnership owns a 210 MW gas turbine plant (Nevada Sun-Peak) which has a power purchase agreement with Nevada Power Company. Ocean State Power and Ocean State Power II are two combined cycle gas turbine units built adjacent to each other at different times in Burrillville, Rhode Island. Both of the 254 MW units provide power to Boston Edison Company, New England Power Company, Montaup Electric Company, and Newport Electric Corporation. Terra Comfort Corporation is a wholly owned subsidiary of IES Industries, which also owns Iowa Southern Utilities Company. Terra Comfort Corporation owns two gas turbines, the 70 MW Burlington plant and the 52 MW Centerville plant, that provide peaking power to Iowa Electric Light and Power Company.

The other two entities in this appendix are generation and transmission cooperatives (G&Ts). G&Ts, which are usually tax exempt organizations owned by their member distribution cooperatives, produce and/or buy power for resale to their member distribution cooperations. Most G&Ts are borrowers from the Rural Electrification Administration (REA), and as

such, would be subject to REA rate jurisdiction and file the REA Form 12. Golden Spread Electric Cooperative is a "paper" G&T in that it owns no generating assets. It purchases power for its 11 member distribution cooperatives from other generators (in this case from Southwestern Public Service Company). Golden Spread Electric Cooperative is not an REA borrower and, therefore, is not subject to REA regulations. Effective in 1987, the cooperative's operating revenues came under the jurisdiction of the FERC. Old Dominion Electric Cooperative, which has its own generating capacity (227 MW or 11.6 percent undivided ownership interest in both North Anna Nuclear units 1 and 2 located in Louisa County, Virginia) had been an REA borrower, but recently bought out its obligations to the REA. Effective in 1992, Old Dominion Electric Cooperative came under the jurisdiction of the FERC. It provides wholesale electric service to its 12 member distribution cooperatives.

The Energy Policy Act of 1992 (EPACT) contains a section on the Public Utility Holding Company Act (PUHCA) reform that created a new class of generating facilities called Exempt Wholesale Generators (EWGs). EWGs are described in the act as "any person determined by the Federal Energy Regulatory Commission to be engaged...in the business of owning (and) or operating...eligible facilities and selling electric energy at wholesale." EPACT exempts EWGs from PUHCA, allows for electric utility involvement with EWGs, expands transmission access, and clarifies regulatory jurisdiction to which EWGs will be subject. This PUHCA reform is the latest legislation encouraging deregulation of the electric generating industry -- a movement that began in 1978 with the passage of the Public Utility Regulatory Policies Act of 1978 (PURPA). If the established sales and transmission service thresholds are exceeded, a EWG status would not exempt the requirement to submit the FERC Form 1.

As of December 31, 1993, 84 applications were filed with the FERC. A total of 68 EWG Applications were granted (4 in 1992 and 64 in 1993).

Technical Notes

Technical Notes

Data Sources

The *Financial Statistics of Major U.S. Investor-Owned Electric Utilities* publication is prepared by the Survey Management Division; Office of Coal, Nuclear, Electric and Alternate Fuels; Energy Information Administration (EIA); U.S. Department of Energy (DOE). Detailed financial data published in this publication are from the Federal Energy Regulatory Commission (FERC) Form 1, "Annual Report of Major Electric Utilities, Licensees and Others." The Form EIA-861, "Annual Electric Utility Report," data are used in Tables 1 and 2 of this publication to show selected operational data for the total universe of electric utilities. A brief summary of both of these surveys is presented below.

FERC Form 1

The FERC Form 1 is a mandatory annual survey of "major" investor-owned electric utilities. These electric utilities had, in each of the last three consecutive years, sales or transmission service that exceeded one of the following:

- 1 million megawatthours of total annual sales
- 100 megawatthours of annual sales for resale
- 500 megawatthours of annual power exchanges delivered
- 500 megawatthours of annual wheeling for others (deliveries plus losses).

All major investor-owned electric utilities, licensees, or others subject to the Federal Power Act of 1935 must submit this survey to the FERC. Classification of these entities is provided in FERC's Uniform System of Accounts Prescribed for Private Utilities and Licensees and subject to the provisions of the Federal Power Act. In 1993, 179 electric utilities are classified as major.

The FERC Form 1 is used to collect data on income and earnings, taxes, depreciation and amortization, distribution of salaries and wages, electric operating revenues, electric maintenance expenses, generating plant statistics, planned construction data, year-end balance sheets, and general corporate information. Data are also required for electric plant cost and power production expenses from hydroelectric plants with a generator nameplate capacity of 10 megawatts

or larger; steam-electric plants with a generator nameplate capacity of 25 megawatts or more; and gas-turbine plants with a generator nameplate capacity of 10 megawatts or larger.

Instrument and Design History . The Federal Power Commission (FPC) Form 1, the predecessor of the FERC Form 1, was implemented in 1935 by the FPC. When the FPC was merged with the DOE in October 1977, collection and processing of the survey data became the responsibility of the EIA. In 1991, the collection responsibility reverted back to the FERC. This mandatory survey is conducted in accordance with the FERC's *Uniform System of Accounts Prescribed for Private Utilities and Licensees*.

Data Processing . Completed surveys containing data for the preceding calendar year are returned to the FERC on or before April 30. Copies are made available to the EIA for processing. Manual editing of data is completed before data entry. Additional edit checks of the data are performed through computer programs. The program edits include both deterministic checks, in which records are checked for the presence of data in required fields, and statistical checks, in which the data are checked against a range of values based on historical data values and for logical or mathematical consistency with data elements reported in the survey. Discrepancies found in the data, as a result of these checks, are resolved either by the processing office or by further information obtained from a telephone call to the respondent.

Uniformity of Treatment . The electric utilities' statements in this publication were uniformly treated for easy comparison of items (information). These statements were filed by all major U.S. investor-owned electric utilities that are subject to the accounting jurisdiction of the FERC. The Uniform System of Accounts for electric utilities under the jurisdiction of the FERC was prepared with the National Association of Regulatory Utility Commissioners. The National Association of Regulatory Utility Commissioners includes members of the railroad, public utilities, and public service commissions of the 50 States, the District of Columbia, the Commonwealth of Puerto Rico, and the territory of the Virgin Islands. The following Federal regulatory agencies were also included: the Interstate Commerce Commission, the Federal Energy Regulatory Commission, the Federal Communication Commission, the Securities and Exchange Commission, and the Civil Aeronautics

Board. In all material respects, the Uniform System of Accounts conforms with the approved system of the National Association of Regulatory Utility Commissioners. The system was also adopted by certain State commissions. Individual electric utility data are listed by the State in which its corporate records are kept.

Presentation . No attempt has been made to consolidate (in the technical accounting sense) the accounts of the electric utilities included in the summary statements of this publication. The combined totals represent the arithmetic sum of all accounts as reported by the individual electric utilities. Consequently, duplications exist to a limited extent in the composite totals shown in several statements. For example, total assets and the totals for operating revenues and megawatt-hour sales include intercorporate sales. For this publication, investments in jointly owned subsidiaries are stated by the equity method of accounting.

As a result of mergers, consolidations, and property sales to public authorities, as well as the introduction of new electric utilities, the number of investor-owned electric utilities that qualify as a major varies from year-to-year. Year-to-year changes in the respondent population do not significantly affect year-to-year aggregate comparisons. Tables 3 and 5 through 30 contain historical data for 1989 through 1992, representing aggregate financial statistics for investor-owned electric utilities classified as major for that year. All calculations are made on the basis of the respondents' submissions which are in whole dollars and megawatt-hours. Data presented in this publication are considered final.

Clean Air Act Accounting Regulations

The Federal Energy Regulatory Commission (FERC) issued new accounting rules for utilities on March 31, 1993. It is the final order codifying a Notice of Proposed Rulemaking (NOPR) proposing to amend its Uniform Systems of Accounts for public utilities, licensees and natural gas companies under Title IV of the Clean Air Act of 1990 as amended. It adopts accounting requirements for allowances for emissions of sulfur dioxide to be bought, sold, or traded. The FERC made a point of saying the rule is "rate neutral" because the prescribed accounting will reflect the economic effects of whatever ratemaking treatment is granted and does not favor one rate treatment over another.

Under the rule, allowances are classified as inventory. Two new inventory accounts are created - Account 158.1, Allowance Inventory; and Account 158.2, Allowances Withheld. The FERC reasoned that "classifying allowances unto new accounts will enhance the usefulness of a utility's financial statements..." In its introduction to the rule, the FERC stated that the rule is not intended to prescribe the ratemaking treatment for allowances or bar regulatory commissions from adopting any particular ratemaking treatment, and that the proposed new allowance accounts will best meet the stated objectives. However, the FERC also recognized the need for the

eventual development of a ratemaking framework for allowances while specifically declining such framework in this final rule.

The FERC determined that most allowances will be valued at historical cost. Allowances allocated by the Environmental Protection Agency will be valued at zero cost and purchase allowances will be valued at the purchased price. The fair market value of allowances could be determined in at least three ways: by comparing the price of an acquired "package" with and without the allowances; by direct reference to market prices; and by use of ratios, an approach suggested by the National Association of Regulatory Utility Commissioners. The FERC looked with favor on the direct reference to market prices because it will be most readily determinable and easiest to verify.

The FERC also determined that accounting for transfers between affiliates will be at fair market value, a change from the system proposed in the NOPR. They recognized that affiliate transactions are by definition less than arm's length and ruled that the burden of proving fairness of value assigned to the allowances will rest with both the selling and purchasing utility. These utilities must maintain enough information for support of accounting entries used to allow ready identification, analysis and verification of the market value of allowances at the time of the transaction.

The FERC determined that a weighted average cost method must be used in determining the cost of issuing an allowance from inventory. In its introduction, the FERC noted that the weighted average cost method has the advantage of objectivity in that it limits management discretion in determining income and inventory balances.

The FERC ruled that allowance expense will be recorded in new Account 509, Steam Power Generation Operation Expense: Allowances, and said it would require utilities to charge to expense on a monthly basis the cost of allowances, including fractional amounts, corresponding to the amount of sulfur dioxide emitted. It allowed estimates when the actual emission data is not available, with true-ups to the actual data in months when the facts become known. Accounts 407.3 and 407.4, Regulatory Debits and Regulatory Credits, are to be used to record the liability/assets imposed on the utility by ratemaking actions of the regulatory agencies. Further, gains and losses from the disposition of allowances are to be recorded in new accounts 411.8 and 411.9, respectively.

In establishing the accounting framework for treatment of the Clean Air Act Amendments, the FERC established two new balance sheet accounts, 182.3, Other Regulatory Assets; and 254, Other Regulatory Liabilities. They include the amounts of regulatory created assets and liabilities not included in other accounts, resulting from ratemaking actions of regulatory commissions.

Although the FERC in its NOPR had contemplated a two-step process for accounting for gains and losses

on the sale, exchange, or other disposition of allowances, it was decided after considering comments, to proceed on a course it said would simplify the process. If regulators order the gain to be passed onto ratepayers over several years, the gain will not be recognized as income. Losses on disposition of allowances that qualify as regulatory assets would be charged directly to the Other Regulatory Assets account.

In implementing the change to the FERC Form 1, three new supporting schedules were added: (1) Allowances: supporting detail for Accounts 158.1 and 158.2 (reference FERC Form 1 pages no. 228-229); (2) Other Regulatory Assets: supporting detail for Account 182.3 (reference FERC Form 1 page no. 232); and (3) Other Regulatory Liabilities: supporting detail for Account 254 (reference FERC Form 1 page no. 278).

El Paso Electric Company Bankruptcy

On January 8, 1992, El Paso Electric Company filed a voluntary petition for reorganization under Chapter 11 of the United States Bankruptcy Code. The utility is acting as debtor-in-possession which requires certain of its actions to be approved by the Bankruptcy Court. The Bankruptcy Court has confirmed El Paso's suggested plan of reorganization which proposes that the utility be acquired by the Central and Southwest Corporation. Consummation of the plan of reorganization requires satisfaction of certain significant conditions and numerous regulatory approvals.

Pursuant to FERC Order 552, El Paso Electric Company has recognized certain regulatory assets and liabilities according to an established criteria. The net regulatory assets reported in the FERC Form 1 filing for the utility represent a total amount of \$887.6 million. Thus, a consummation of the plan could have a material effect on the amounts currently reported in the financial statements. According to the report of El Paso's independent auditor, if no reorganization plan is approved, the possibility exists that the utility's assets could be liquidated. The FERC Form 1 submitted for 1993 does not reflect any adjustments that might result as an outcome of these uncertainties.

Public Service Company of New Hampshire Bankruptcy

Public Service Company of New Hampshire filed a petition for reorganization under Chapter 11 of the Federal Bankruptcy Code on January 28, 1988. The electric utility acted as debtor-in-possession for a period of approximately 28 months and continued to operate its business substantially as before, subject to the supervision of the Bankruptcy Court. On May 16, 1991, Public Service Company of New Hampshire emerged from bankruptcy in accordance with a reorganization plan filed January 2, 1990, with the Bankruptcy Court. According to the terms of the reorganization plan, Public Service Company of New Hampshire would merge with Northeast Utilities

Service Company (NUSCO) and NU Acquisition Corporation (NUCA) and would remain as the surviving corporation. Northeast Utilities (NU) would then acquire the surviving Public Service Company of New Hampshire. Regulatory approvals were granted and the closing of the merger occurred on June 5, 1992.

The reorganization was accounted for using fresh-start accounting. All assets and liabilities were restated to their fair-market-value as of the reorganization date, and, a distribution of approximately \$2.4 billion in cash, securities, and assumed liabilities was made to former creditors and equity security holders. Unamortized debt expense associated with debt issues repaid under the reorganization plan was eliminated, and the expenses associated with the issuance of new debt and preferred stock, capitalized and amortized over the terms of these issues.

In order to properly reflect the emergence of the restructured Public Service Company of New Hampshire, the company filed its 1991 FERC Form 1 incorporating two Statements of Income and Retained Earnings, Cash Flows, and supporting schedules; one for the period January 1 through May 15, 1991, and the other for May 16 through December 31, 1991. A single Balance Sheet was submitted dated as of December 31, 1991. By filing in this manner, the fresh-start accounting associated with the emergence from the bankruptcy could be readily represented.

Pursuant to the reorganization plan resulting from the bankruptcy, the interest in the Seabrook plant was acquired on June 5, 1992, by North Atlantic Energy Corporation, a subsidiary of Northeast Utilities. Public Service Company of New Hampshire and North Atlantic Energy Corporation submitted a separate FERC Form 1 for 1992 and 1993 and are thus included in both the summary and detailed statistics.

Form EIA-861

The Form EIA-861 is a mandatory census of electric utilities in the United States, its territories, and Puerto Rico. The survey is used to collect information on power production and sales data from approximately 3,200 electric utilities. Data collected are used to maintain and update the electric utility frame data base for the EIA. This data base supports queries from the Executive Branch, Congress, other public agencies, and the general public. Summary data from the Form EIA-861 are also contained in the *Electric Power Monthly*, the *Electric Power Annual*, the *Electric Sales and Revenue*, the *Annual Outlook for U.S. Electric Power*, the *Financial Statistics of Major U.S. Investor-Owned Electric Utilities*, and the *Financial Statistics of Major U.S. Publicly Owned Electric Utilities*. These reports present aggregate totals for electric utilities on a national level, by State, and by ownership type.

Instrument and Design History . The Form EIA-861 was implemented in January 1985 to collect data as of year-end 1984. The Federal Energy Administration Act of 1974 (Public Law 93-275) defines the legislative authority to collect these data.

Data Processing . The Form EIA-861 is mailed to the respondents in January to collect data of the preceding calendar year. The completed surveys are returned to the EIA by May 1. Data are manually edited before being entered into the interactive on-line system. Internal edit checks are performed to verify that current data total across and between schedules, and are comparable to data reported the previous year. Edit checks are also performed to compare data reported on the Form EIA-861 and similar data reported on the Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions," the FERC Form 1, "Annual Report of Major Electric Utilities, Licensees and Others," and the Form EIA-412, "Annual Report of Public Electric Utilities." These are utility-level checks. Respondents are called to clarify reported data and to obtain missing data.

Detailed comparisons and descriptions of conceptual problems affecting the quality of the data are discussed in the report, *An Assessment of the Quality of Selected EIA Data Series: Electric Power Data*. One example of such a problem inherent in data on electricity sales is that the sectoral classification scheme can vary from utility to utility, as influenced by the local public utility commission.

Data Quality

The Office of Coal, Nuclear, Electric and Alternate Fuels (CNEAF) is responsible for routine data improvement and quality assurance. All operations at CNEAF are done in accordance with formal standards established by the EIA. Data improvement efforts include verification of data-keyed input by automatic computerized methods, editing by subject matter specialists, and follow-up on nonrespondents. The CNEAF reviews the structure of information requirements and proposed designs for new and revised data collection surveys and systems. Once started, the performance of working data collection systems is also validated. Computerized respondent data files are checked to identify those which fail to respond to the survey. The EIA tries to obtain required information by encouraging the cooperation of nonrespondents. By law, nonrespondents may be fined or penalized for not filing a survey.

The CNEAF screens surveys for completeness, and keys the data onto computer tapes for storage. The data are transferred to random access data bases for computer processing. The information coded on the computer tapes is manually spot-checked against the surveys to certify accuracy of the tapes. To ensure EIA quality standards, formulas using the past history of data values in the data base have been designed and implemented to automatically check data input for errors. Data values falling outside the ranges prescribed in the formulas are verified by telephoning respondents to resolve any discrepancies.

Conceptual problems affecting the quality of data are discussed in the report, *An Assessment of the Quality of Selected EIA Data Series: Electric Power Data*. This report is published by the Office of Statistical Standards in the EIA.

Data Editing System

Data from the surveys are edited using automated systems. The edit includes deterministic and statistical checks; the deterministic part of the edit checks for the presence of required fields and their validity. Statistical checks use estimation techniques to validate data according to their behavior in the past and in comparison to other current fields.

Confidentiality of the Data

Data collected on the surveys for this publication are not confidential.

Rounding Rules for Data

Given a number with r digits to the left of the decimal and $d+t$ digits in the fraction part, with d being the place to which the number is to be rounded and t being the remaining digits which will be truncated. This number is then rounded to $r+d$ digits by adding five to the $(r+d+1)$ th digit when the number is positive or by subtracting five when the number is negative. The t digits are then truncated at the $(r+d+1)$ th digit.

Data Correction and Revision Procedures

The CNEAF has adopted the following policy with respect to the revision and correction of recurrent data in energy publications:

- Annual survey data collected by this office are published either as preliminary or final when first appearing in a data report. Data initially released as preliminary will be so noted in the report. These data will be revised, if necessary, and declared final in the next publication of the data.
- All monthly and quarterly survey data collected by this office are published as preliminary. These data are revised only after the completion of the 12-month cycle of the data. No revisions are made to the published data before this.
- The magnitudes of changes due to revisions experienced in the past will be included in the data reports, so that the reader can assess the accuracy of the data.
- After data are published as final, corrections will be made only in the event of a greater than one percent difference at the national level. Corrections for differences that are less than the before-mentioned threshold are left to the discretion of the Office Director.

In accordance with this policy, the CNEAF has revised the 1989 through 1992 data for UtiliCorp United Incorporated in Tables 6 and 28. In Table 6, this electric utility's "Other Utility Operating Revenues"; "Other Utility Operating Expenses"; and

"Net Other Utility Operating Income" have been reclassified to the associated "Gas Utility Operating Income" accounts (Table D1). For Table 28, "Other

Utility Plant" accounts have been reclassified as "Gas Utility Plant" accounts (Table D2).

Table D1. Comparison of Published Data in the Composite Statement of Income and Retained Earnings for Major Investment-Owned Electric Utilities, 1989-1992

Item	Prior Published	Revised Published	Percent Change
1992			
Gas Utility Operating Income

Table D3. Source of Data Used in Formulas and Calculations

Abbreviation	Description	Table
ABFUDC	Allowance for Borrowed Funds Used During Construction	Statement of Income
AOFUDC	Allowance for Other Funds Used During Construction	Statement of Income
COP	Cash Outflows for Plant	Cash Flows
CSDD	Dividends Declared-Common Stock	Retained Earnings
DITCE	Provision for Deferred Income Taxes (Credit)-Electric	Statement of Income
DITE	Provision for Deferred Income Taxes-Electric	Statement of Income
EDA	Electric Depreciation and Amortization Expenses	Statement of Income
EOME	Electric Operation and Maintenance Expenses	Statement of Income
EOR	Electric Operating Revenues	Statement of Income
FITE	Federal Income Taxes-Electric	Statement of Income
GOR	Gas Operating Revenues	Statement of Income
IE	Interest Expenses	Statement of Income
ILTD	Interest on Long-term Debt	Statement of Income
ITCA	Investment Tax Credit Adjustments (Net)	Statement of Income
NCC	Noncash Charges Credits (Depreciation and Depletion, Amortization, Deferred Income Taxes (Net), Investment Tax Credit Adjustment (Net), and "Other")	Cash Flows
NEOI	Net Electric Operating Income	Statement of Income
NEUP	Net Electric Utility Plant (Less Nuclear Fuel)	Balance Sheet
NF	Nuclear Fuel	Balance Sheet
NI	Net Income	Statement of Income
NOID	Net Other Income and Deductions	Statement of Income
NUOI	Net Utility Operating Income	Statement of Income
OITE	Other Income Taxes-Electric	Statement of Income
OUOR	Other Utility Operating Revenues	Statement of Income
PSI	Preferred Stock Issued	Balance Sheet
PSib	Preferred Stock Issued for the beginning of the year	Balance Sheet
PSie	Preferred Stock Issued for the end of the year	Balance Sheet
PSDD	Dividends Declared-Preferred Stock	Retained Earnings
RE	Retained Earnings	Balance Sheet
STD	Short-term Debt (Notes Payable)	Balance Sheet
TAOD	Total Assets and Other Debits	Balance Sheet
TAUP	Total All Utility Plant	Balance Sheet
TCAA	Total Current and Accrued Assets	Balance Sheet
TCAL	Total Current and Accrued Liabilities	Balance Sheet
TEOE	Total Electric Operating Expenses	Statement of Income
TEUP	Total Electric Utility Plant	Balance Sheet
TLTD	Total Long-term Debt	Balance Sheet
TLTD _b	Total Long-term Debt for the beginning of the year	Balance Sheet
TLTD _e	Total Long-term Debt for the end of the year	Balance Sheet
TOI	Total Other Income	Statement of Income
TOITE	Taxes Other than Income Taxes-Electric	Statement of Income
TOUP	Total Other Utility Plant	Balance Sheet
TPC	Total Proprietary Capital	Balance Sheet
TPCb	Total Proprietary Capital for the beginning of the year	Balance Sheet
TPCe	Total Proprietary Capital for the end of the year	Balance Sheet
TUFIT	Total Utility Federal Income Taxes	Statement of Income
TUOIT	Total Utility Other Income Taxes	Statement of Income
TUOR	Total Utility Operating Revenues	Statement of Income
UPDAD	All Utility Plant Accumulated Provisions for Depreciation, Amortization, and Depletion	Balance Sheet
UUSE	Unappropriated Undistributed Subsidiary Earnings	Balance Sheet

Formulas and Calculations

Ratios Based on the Composite Statement of Income and Retained Earnings for Investor-Owned Electric Utilities

The following formulas are used to calculate the financial indicators of Investor-Owned Electric Utilities listed in Table 9, "Composite Financial Indicators by Major U.S. Investor-Owned Electric Utilities, 1988-1992."

Electric Operating Revenues as a Percent of Total Operating Revenues =

$$\frac{\sum_i (EOR_i)}{\sum_i (TUOR_i)} \times 100, \quad (D1)$$

where EOR_i is the Electric Operating Revenues for the i^{th} major utility; and, $TUOR_i$ is the Total Utility Operating Revenues for the i^{th} major utility.

Electric Operation and Maintenance Expenses as a Percent of Electric Operating Revenues =

$$\frac{\sum_i (EOME_i)}{\sum_i (EOR_i)} \times 100, \quad (D2)$$

where $EOME_i$ is the Electric Operation and Maintenance Expenses for the i^{th} major utility; and, EOR_i is the Electric Operating Revenues for the i^{th} major utility.

Electric Depreciation and Amortization as a Percent of Electric Operating Revenues =

$$\frac{\sum_i (EDA_i)}{\sum_i (EOR_i)} \times 100, \quad (D3)$$

where EDA_i is the Electric Depreciation and Amortization Expenses for the i^{th} major utility; and, EOR_i is the Electric Operating Revenues for the i^{th} major utility.

Federal Income Taxes-Electric as a Percent of Electric Operating Revenues =

$$\frac{\sum_i (FITE_i)}{\sum_i (EOR_i)} \times 100, \quad (D4)$$

where $FITE_i$ is the Federal Income Taxes-Electric for the i^{th} major utility; and, EOR_i is the Electric Operating Revenues for the i^{th} major utility.

Other Taxes-Electric as a Percent of Electric Operating Revenues =

$$\frac{\sum_i (TOITE_i + OITE_i)}{\sum_i (EOR_i)} \times 100, \quad (D5)$$

where $TOITE_i$ is Taxes Other than Income Taxes-Electric for the i^{th} major utility; $OITE_i$ is Other Income Taxes-Electric for the i^{th} major utility; and, EOR_i is the Electric Operating Revenues for the i^{th} major utility.

Provision for Deferred Taxes on Income as a Percent of Electric Operating Revenues =

$$\frac{\sum_i (DITE_i)}{\sum_i (EOR_i)} \times 100, \quad (D6)$$

where $DITE_i$ is the Provision for Deferred Income Taxes-Electric for the i^{th} major utility; and, EOR_i is the Electric Operating Revenues for the i^{th} major utility.

Income Taxes Deferred in Prior Years (Credit) as a Percent of Electric Operating Revenues =

$$\frac{\sum_i (DITCE_i)}{\sum_i (EOR_i)} \times 100, \quad (D7)$$

where $DITCE_i$ is the Provision for Deferred Income Taxes (Credit)-Electric for the i^{th} major utility; and, EOR_i is the Electric Operating Revenues for the i^{th} major utility.

Investment Tax Credit Adjustments (Net) as a Percent of Electric Operating Revenues =

$$\frac{\sum_i (ITCA_i)}{\sum_i (EOR_i)} \times 100, \quad (D8)$$

where $ITCA_i$ is the Investment Tax Credit Adjustments (Net) for the i^{th} major utility; and, EOR_i is the Electric Operating Revenues for the i^{th} major utility.

Total Electric Operating Expenses as a Percent of Electric Operating Revenues =

$$\frac{\sum_i (TEOE_i)}{\sum_i (EOR_i)} \times 100, \quad (D9)$$

where $TEOE_i$ is the Total Electric Operating Expenses for the i^{th} major utility; and, EOR_i is the Electric Operating Revenues for the i^{th} major utility.

Net Electric Operating Income as a Percent of Electric Operating Revenues =

$$\frac{\sum_i (NEOI_i)}{\sum_i (EOR_i)} \times 100, \quad (D10)$$

where $NEOI_i$ is the Net Electric Operating Income for the i^{th} major utility; and, EOR_i is the Electric Operating Revenues for the i^{th} major utility.

Preferred Stock Dividends Declared as a Percent of Operating Revenues =

$$\frac{\sum_i (PSDD_i)}{\sum_i (TUOR_i)} \times 100, \quad (D11)$$

where $PSDD_i$ is the Dividends Declared-Preferred Stock for the i^{th} major utility; and, $TUOR_i$ is the Total Utility Operating Revenues for the i^{th} major utility.

Preferred Stock Average Dividend Rate =

$$\frac{\sum_i (PSDD_i)}{\sum_i \frac{(PSI_B) + (PSI_E)}{2}} \times 100, \quad (D12)$$

where $PSDD_i$ is the Dividends Declared-Preferred Stock for the i^{th} major utility; PSI_B is the Preferred Stock Issued for the beginning of the year; and, PSI_E is the Preferred Stock Issued for the end of the year. The average is calculated by dividing the sum by two.

Interest Coverage =

$$\frac{\sum_i (NI_i)}{\sum_i (PSDD_i)}, \quad (D13)$$

where NI_i is the Net Income for the i^{th} major utility; and, $PSDD_i$ is the Dividends Declared-Preferred Stock for the i^{th} major utility.

Common Stock Dividends as a Percent of Operating Revenues =

$$\frac{\sum_i (CSDD_i)}{\sum_i (TUOR_i)} \times 100, \quad (D14)$$

where $CSDD_i$ is the Dividends Declared-Common Stock for the i^{th} major utility; and, $TUOR_i$ is the Total Utility Operating Revenues for the i^{th} major utility.

Percent of Earnings Available for Common Stock =

$$\frac{\sum_i (CSDD_i)}{\sum_i (NI_i - PSDD_i)} \times 100, \quad (D15)$$

where $CSDD_i$ is the Dividends Declared-Common Stock for the i^{th} major utility; NI_i is the Net Income for the i^{th} major utility; and, $PSDD_i$ is the Dividends Declared-Preferred Stock for the i^{th} major utility.

Dividends Declared as Percent of Average Common Stock Equity =

$$\frac{\sum_i (CSDD_i)}{\sum_i \frac{(TPC_B + TPC_E) - (PSI_B + PSI_E)}{2}} \times 100, \quad (D16)$$

where $CSDD_i$ is the Dividends Declared-Common Stock for the i^{th} major utility; TPC_B is the Total Proprietary Capital for the beginning of the year for the i^{th} major utility; TPC_E is the Total Proprietary Capital for the end of the year for the i^{th} major utility; PSI_B is the Preferred Stock Issued for the beginning of the year; and, PSI_E is the Preferred Stock Issued for the end of the year for the i^{th} major utility. An average is calculated by dividing the sum by two.

Interest on Long-term Debt as a Percent of Total Operating Revenues =

$$\frac{\sum_i (ILTD_i)}{\sum_i (TUOR_i)} \times 100, \quad (D17)$$

where $ILTD_i$ is the Interest on Long-term Debt for the i^{th} major utility; and, $TUOR_i$ is the Total Utility Operating Revenues for the i^{th} major utility.

Average Interest Rate on Long-term Debt =

$$\frac{\sum_i (ILTD_i)}{\sum_i \frac{(TLTD_B) + (TLTD_E)}{2}} \times 100, \quad (D18)$$

where $ILTD_i$ is the Interest on Long-term Debt for the i^{th} major utility; $TLTD_B$ is the Total Long-term

Debt for the beginning of the year for the i^{th} major utility; and, $TLTD_i$ is the Total Long-term Debt for the end of the year for the i^{th} major utility.

Net Income Divided by Operating Revenues (Profit Margin) =

$$\frac{\sum_i (NI_i)}{\sum_i (TUOR_i)}, \quad (D19)$$

where NI_i is the Net Income for the i^{th} major utility; and, $TUOR_i$ is the Total Utility Operating Revenues for the i^{th} major utility.

Composite Financial Indicators for Investor-Owned Electric Utilities

Electric Fixed Asset (Net Plant) Turnover =

$$\frac{\sum_i (EOR_i)}{\sum_i (NEUP_i)}, \quad (D20)$$

where EOR_i is the Electric Operating Revenues for the i^{th} major utility; and, $NEUP_i$ is the Net Electric Utility Plant (less nuclear fuel) for the i^{th} major utility.

Total Asset Turnover =

$$\frac{\sum_i (TUOR_i)}{\sum_i (TAOD_i)}, \quad (D21)$$

where $TUOR_i$ is the Total Utility Operating Revenues for the i^{th} major utility; and, $TAOD_i$ is the Total Assets and Other Debits for the i^{th} major utility.

Total Electric Utility Plant plus Nuclear Fuel per Dollar of Revenue =

$$\frac{\sum_i (TEUP_i + NF_i)}{\sum_i (EOR_i)}, \quad (D22)$$

where $TEUP_i$ is the Total Electric Utility Plant for the i^{th} major utility; NF_i is the Nuclear Fuel for the i^{th} major utility; and, EOR_i is the Electric Operating Revenues for the i^{th} major utility.

Other Utility Plant per Dollar of Revenue =

$$\frac{\sum_i (TOUP_i)}{\sum_i (GOR_i + OUOR_i)}, \quad (D23)$$

where $TOUP_i$ is the Total Other Utility Plant for the i^{th} major utility; GOR_i is the Gas Operating Revenues for the i^{th} major utility; and, $OUOR_i$ is the Other Utility Operating Revenues for the i^{th} major utility.

Total Utility Plant per Dollar of Revenue =

$$\frac{\sum_i (TAUP_i)}{\sum_i (TUOR_i)}, \quad (D24)$$

where $TAUP_i$ is the Total All Utility Plant for the i^{th} major utility; and, $TUOR_i$ is the Total Utility Operating Revenues for the i^{th} major utility.

Total Electric Plant to Total Assets =

$$\frac{\sum_i (TEUP_i)}{\sum_i (TAOD_i)} \times 100, \quad (D25)$$

where $TEUP_i$ is the Total Electric Utility Plant for the i^{th} major utility; and, $TAOD_i$ is the Total Assets and Other Debits for the i^{th} major utility.

Net Electric Plant to Total Assets =

$$\frac{\sum_i (NEUP_i)}{\sum_i (TAOD_i)} \times 100, \quad (D26)$$

where $NEUP_i$ is the Net Electric Utility Plant (less nuclear fuel) for the i^{th} major utility; and, $TAOD_i$ is the Total Assets and Other Debits for the i^{th} major utility.

Total Utility Operating Revenue plus Other Income as a Percent of Total Assets and Other Debits =

$$\frac{\sum_i (TUOR_i + TOI_i)}{\sum_i (TAOD_i)} \times 100, \quad (D27)$$

where $TUOR_i$ is the Total Utility Operating Revenues for the i^{th} major utility; TOI_i is the Total Other Income for the i^{th} major utility; and, $TAOD_i$ is the Total Assets and Other Debits for the i^{th} major utility.

Electric Utility Depreciation and Amortization to Total Electric Utility Plant =

$$\frac{\sum_i (EDA_i)}{\sum_i (TEUP_i)} \times 100, \quad (D28)$$

where EDA_i is the Electric Depreciation and Amortization Expenses for the i^{th} major utility; and, $TEUP_i$ is the Total Electric Utility Plant for the i^{th} major utility.

Current Assets to Current Liabilities =

$$\frac{\sum_i (TCAA_i)}{\sum_i (TCAL_i)} \quad (D29)$$

where $TCAA_i$ are the Total Current and Accrued Assets for the i^{th} major utility; and, $TCAL_i$ are the Total Current and Accrued Liabilities for the i^{th} major utility.

Long-term Debt to Capitalization =

$$\frac{\sum_i (TLTD_i)}{\sum_i (TPC_i + TLTD_i)} \times 100, \quad (D30)$$

where $TLTD_i$ is the Total Long-term Debt for the i^{th} major utility; and, TPC_i is the Total Proprietary Capital for the i^{th} major utility.

Preferred Stock to Capitalization =

$$\frac{\sum_i (PSI_i)}{\sum_i (TPC_i + TLTD_i)} \times 100, \quad (D31)$$

where PSI_i is the Preferred Stock Issued for the i^{th} major utility; TPC_i is the Total Proprietary Capital for the i^{th} major utility; and, $TLTD_i$ is the Total Long-term Debt for the i^{th} major utility.

Common Stock and Paid-in Capital to Capitalization =

$$\frac{\sum_i (TPC_i - PSI_i - RE_i - UUSE_i)}{\sum_i (TPC_i + TLTD_i)} \times 100, \quad (D32)$$

where TPC_i is the Total Proprietary Capital for the i^{th} major utility; PSI_i is the Preferred Stock Issued for the i^{th} major utility; RE_i is the Retained Earnings for the i^{th} major utility; $UUSE_i$ is the Unappropriated Undistributed Subsidiary Earnings for the i^{th} major utility; and, $TLTD_i$ is the Total Long-term Debt for the i^{th} major utility.

Retained Earnings to Capitalization =

$$\frac{\sum_i (RE_i + UUSE_i)}{\sum_i (TPC_i + TLTD_i)} \times 100, \quad (D33)$$

where RE_i is the Retained Earnings for the i^{th} major utility; $UUSE_i$ is the Unappropriated Undistributed Subsidiary Earnings for the i^{th} major utility; TPC_i is the Total Proprietary Capital for the i^{th} major utility;

and, $TLTD_i$ is the Total Long-term Debt for the i^{th} major utility.

Common Equity as a Percent of Total Capitalization (Average) =

$$\frac{\frac{(TPC_B + TPC_E) - (PSI_B + PSI_E)}{2}}{\frac{(TPC_B + TPC_E) + (TLTD_B + TLTD_E)}{2}} \times 100, \quad (D34)$$

where TPC_B is the Total Proprietary Capital for the beginning of the year for the i^{th} major utility; TPC_E is the Total Proprietary Capital for the end of the year for the i^{th} major utility; PSI_B is the Preferred Stock Issued for the beginning of the year for the i^{th} major utility; PSI_E is the Preferred Stock Issued for the end of the year for the i^{th} major utility; $TLTD_B$ is the Total Long-term Debt for the beginning of the year for the i^{th} major utility; and, $TLTD_E$ is the Total Long-term Debt for the end of the year for the i^{th} major utility. An average year's balance is calculated by dividing the sum by two. Capitalization is the sum of an average year's balance of $(TPC + TLTD)/2$.

Short-term Debt to Capitalization =

$$\frac{\sum_i (STD_i)}{\sum_i (TPC_i + TLTD_i + STD_i)} \times 100, \quad (D35)$$

where STD_i is the Short-term Debt (Notes Payable) for the i^{th} major utility; TPC_i is the Total Proprietary Capital for the i^{th} major utility; and, $TLTD_i$ is the Total Long-term Debt for the i^{th} major utility.

Long-term Debt to Capitalization =

$$\frac{\sum_i (TLTD_i)}{\sum_i (TPC_i + TLTD_i + STD_i)} \times 100, \quad (D36)$$

where $TLTD_i$ is the Total Long-term Debt for the i^{th} major utility; TPC_i is the Total Proprietary Capital for the i^{th} major utility; and, STD_i is the Short-term Debt (Notes Payable) for the i^{th} major utility.

Preferred Stock to Capitalization =

$$\frac{\sum_i (PSI_i)}{\sum_i (TPC_i + TLTD_i + STD_i)} \times 100, \quad (D37)$$

where PSI_i is the Preferred Stock Issued for the i^{th} major utility; TPC_i is the Total Proprietary Capital for the i^{th} major utility; $TLTD_i$ is the Total Long-term Debt for the i^{th} major utility; and, STD_i is the Short-term Debt (Notes Payable) for the i^{th} major utility.

Common Equity to Capitalization =

$$\frac{\sum_i (TPC_i - PSI_i)}{\sum_i (TPC_i + TLTD_i + STD_i)} \times 100, \quad (D38)$$

where TPC_i is the Total Proprietary Capital for the i^{th} major utility; PSI_i is the Preferred Stock Issued for the i^{th} major utility; $TLTD_i$ is the Total Long-term Debt for the i^{th} major utility; and, STD_i is the Short-term Debt (Notes Payable) of the i^{th} major utility.

Internally Generated Funds to Cash Outflows for Plant =

$$\frac{\sum_i (NI_i + NCC_i + AOFUDC_i - PSDD_i - CSDD_i)}{\sum_i (COP_i)} \times 100, \quad (D39)$$

where NI_i is Net Income of the i^{th} major utility; NCC_i is the Noncash Charges Credits (Depreciation and Depletion, Amortization, Deferred Income Taxes (Net), Investment Tax Credit Adjustment (Net), and "Other") for the i^{th} major utility; $AOFUDC_i$ is the Allowance for Other Funds Used During Construction for the i^{th} major utility; $PSDD_i$ is the Dividends Declared-Preferred Stock for the i^{th} major utility; $CSDD_i$ is the Dividends Declared-Common Stock for the i^{th} major utility; and, COP_i is the Cash Outflows for Plant for the i^{th} major utility.

Internally Generated Funds to Electric Operating Revenues =

$$\frac{\sum_i (NI_i + NCC_i - AOFUDC_i - PSDD_i - CSDD_i)}{\sum_i (EOR_i)} \times 100, \quad (D40)$$

where NI_i is Net Income of the i^{th} major utility; NCC_i is the Noncash Charges Credits (Depreciation and Depletion, Amortization, Deferred Income Taxes (Net), Investment Tax Credit Adjustment (Net), and "Other") for the i^{th} major utility; $AOFUDC_i$ is the Allowance for Other Funds Used During Construction for the i^{th} major utility; $PSDD_i$ is the Dividends Declared-Preferred Stock for the i^{th} major utility; $CSDD_i$ is the Dividends Declared-Common Stock for the i^{th} major utility; and, EOR_i is the Electric Operating Revenues for the i^{th} major utility.

Interest Coverage Before Taxes with AFUDC =

$$\frac{\sum_i (NUOI_i + TUFIT_i + TUOIT_i + NOID_i + ABFUDC_i)}{\sum_i (IE_i)}, \quad (D41)$$

where $NUOI_i$ is Net Utility Operating Income for the i^{th} major utility; $TUFIT_i$ is the Total Utility Federal

Income Taxes for the i^{th} major utility; $TUOIT_i$ is the Total Utility Other Income Taxes for the i^{th} major utility; $NOID_i$ is the Net Other Income and Deductions for the i^{th} major utility; $ABFUDC_i$ is the Allowance for Borrowed Funds Used During Construction for the i^{th} major utility; and, IE_i is the Interest Expenses for the i^{th} major utility.

Interest Coverage Before Taxes without AFUDC =

$$\frac{\sum_i (NUOI_i + TUFIT_i + TUOIT_i + NOID_i - AOFUDC_i)}{\sum_i (IE_i)}, \quad (D42)$$

where $NUOI_i$ is Net Utility Operating Income for the i^{th} major utility; $TUFIT_i$ is the Total Utility Federal Income Taxes for the i^{th} major utility; $TUOIT_i$ is the Total Utility Other Income Taxes for the i^{th} major utility; $NOID_i$ is the Net Other Income and Deductions for the i^{th} major utility; $AOFUDC_i$ is the Allowance for Other Funds Used During Construction for the i^{th} major utility; and, IE_i is the Interest Expenses for the i^{th} major utility.

Total Debt to Total Assets =

$$\frac{\sum_i (TLTD_i + STD_i)}{\sum_i (TAOD_i)} \times 100, \quad (D43)$$

where $TLTD_i$ is the Total Long-term Debt for the i^{th} major utility; STD_i is the Short-term Debt (Notes Payable) for the i^{th} major utility; and, $TAOD_i$ is the Total Assets and Other Debits for the i^{th} major utility.

Common Stock Equity to Total Assets =

$$\frac{\sum_i (TPC_i - PSI_i)}{\sum_i (TAOD_i)} \times 100, \quad (D44)$$

where TPC_i is the Total Proprietary Capital for the i^{th} major utility; PSI_i is the Preferred Stock Issued for the i^{th} major utility; and, $TAOD_i$ is the Total Assets and Other Debits for the i^{th} major utility.

Accumulated Provision for Depreciation as a Percent of Total Utility Plant =

$$\frac{\sum_i (UPDAD_i)}{\sum_i (TAUP_i)} \times 100, \quad (D45)$$

where $UPDAD_i$ is the All Utility Plant Accumulated Provisions for Depreciation, Amortization, and Depletion for the i^{th} major utility; and, $TAUP_i$ is the Total All Utility Plant for the i^{th} major utility.

Return on Average Common Stock Equity =

$$\frac{\sum_i (NI_i)}{\sum_i \frac{(TPC_B + TPC_E) - (PSI_B + PSI_E)}{2}} \times 100, \quad (D46)$$

where NI_i is the Net Income for the i^{th} major utility; TPC_B is the Total Proprietary Capital for the beginning of the year for the i^{th} major utility; TPC_E is the Total Proprietary Capital for the end of the year for the i^{th} major utility; PSI_B is the Preferred Stock Issued for the beginning of the year for the i^{th} major utility; and, PSI_E is the Preferred Stock Issued for the end of the year for the i^{th} major utility. An average for the year is calculated by dividing the sum by two.

Return on Average Common Equity =

$$\frac{\sum_i (NI_i - PSDD_i)}{\sum_i \frac{(TPC_B + TPC_E) - (PSI_B + PSI_E)}{2}} \times 100, \quad (D47)$$

where NI_i is the Net Income for the i^{th} major utility; $PSDD_i$ is the Dividends Declared-Preferred Stock for the i^{th} major utility; TPC_B is the Total Proprietary Capital for the beginning of the year for the i^{th} major utility; TPC_E is the Total Proprietary Capital for the end of the year for the i^{th} major utility; PSI_B is the Preferred Stock Issued for the beginning of the year for the i^{th} major utility; and, PSI_E is the Preferred Stock Issued for the end of the year for the i^{th} major utility. An average for the year is calculated by dividing the sum by two.

Return on Investment =

$$\frac{\sum_i (NI_i)}{\sum_i (TAOD_i)} \times 100, \quad (D48)$$

where NI_i is the Net Income for the i^{th} major utility; and, $TAOD_i$ is the Total Assets and Other Debits for the i^{th} major utility.

Selected Financial Indicators for Investor-Owned Electric Utilities

The following formulas are used to calculate the financial indicators of Investor-Owned Electric Utilities listed in Table 44, "Selected Financial Indicators by major U.S. Investor-Owned Electric Utility Within State."

Common Equity to Capitalization =

$$\frac{TPC - PSI}{TPC + TLTD + STD} \times 100, \quad (D49)$$

where TPC is the Total Proprietary Capital; PSI is the Preferred Stock Issued; $TLTD$ is the Total Long-term

Debt; and, STD is the Short-term Debt (Notes Payable). Capitalization is the sum of $TPC + TLTD + STD$.

Preferred Stock to Capitalization =

$$\frac{PSI}{TPC + TLTD + STD} \times 100, \quad (D50)$$

where PSI is the Preferred Stock Issued; TPC is the Total Proprietary Capital; $TLTD$ is the Total Long-term Debt; and, STD is the Short-term Debt (Notes Payable). Capitalization is the sum of $TPC + TLTD + STD$.

Long-term Debt to Capitalization =

$$\frac{TLTD}{TPC + TLTD + STD} \times 100, \quad (D51)$$

where $TLTD$ is the Total Long-term Debt; TPC is the Total Proprietary Capital; and, STD is the Short-term Debt (Notes Payable). Capitalization is the sum of $TPC + TLTD + STD$.

Short-term Debt to Capitalization =

$$\frac{STD}{TPC + TLTD + STD} \times 100, \quad (D52)$$

where STD is the Short-term Debt (Notes Payable); TPC is the Total Proprietary Capital; and, $TLTD$ is the Total Long-term Debt. Capitalization is the sum of $TPC + LTD + STD$.

Average Common Equity as a Percent of Total Capitalization =

$$\frac{\frac{(TPC_B + TPC_E) - (PSI_B + PSI_E)}{2}}{\frac{(TPC_B + TPC_E) + (TLTD_B + TLTD_E)}{2}} \times 100, \quad (D53)$$

where TPC_B is the Total Proprietary Capital for the beginning of the year; TPC_E is the Total Proprietary Capital for the end of the year; PSI_B is the Preferred Stock Issued for the beginning of the year; PSI_E is the Preferred Stock Issued for the end of the year; $TLTD_B$ is the Total Long-term Debt for the beginning of the year; and, $TLTD_E$ is the Total Long-term Debt for the end of the year. An average year's balance is calculated by dividing the sum by two. Capitalization is the sum of an average year's balance of $(TPC + TLTD)/2$.

Return on Average Common Equity =

$$\frac{NI - PSDD}{\frac{(TPC_B + TPC_E) - (PSI_B + PSI_E)}{2}} \times 100, \quad (D54)$$

where NI is the Net Income; $PSDD$ is the Dividends Declared-Preferred Stock; TPC_B is the Total Proprietary Capital for the beginning of the year; TPC_E is the

Total Proprietary Capital for the end of the year; PSI_B is the Preferred Stock Issued for the beginning of the year; and, PSI_E is the Preferred Stock Issued for the end of the year. An average year's balance is calculated by dividing the sum by two.

Total Utility Operating Revenue Plus Other Income as a Percent of Total Assets and Other Debits =

$$\frac{TUOR + TOI}{TAOD} \times 100, \quad (D55)$$

where $TUOR$ is the Total Utility Operating Revenues; TOI is the Total Other Income; and, $TAOD$ is the Total Assets and Other Debits.

Interest Coverage Before Taxes with $AFUDC$

$$\frac{\left(\begin{array}{c} NUOI + TUFIT \\ + TUOIT + NOID + ABFUDC \end{array} \right)}{IE}, \quad (D56)$$

where $NUOI$ is the Net Utility Operating Income; $TUFIT$ is the Total Utility Federal Income Taxes; $TUOIT$ is the Total Utility Other Income Taxes; $NOID$ is the Net Other Income and Deductions; $ABFUDC$ is the Allowance for Borrowed Funds Used During Construction ($AFUDC$); and, IE is the Interest Expenses.

Interest Coverage Before Taxes without $AFUDC$ =

$$\frac{\left(\begin{array}{c} NUOI + TUFIT \\ + TUOIT + NOID - AOFUDC \end{array} \right)}{IE}, \quad (D57)$$

where $NUOI$ is the Net Utility Operating Income; $TUFIT$ is the Total Utility Federal Income Taxes; $TUOIT$ is Total Utility Other Income Taxes; $NOID$ is the Net Other Income and Deductions; $AOFUDC$ is the Allowance for Other Funds Used During Construction; and, IE is the Interest Expenses.

Current Assets to Current Liabilities =

$$\frac{TCAA}{TCAL}, \quad (D58)$$

where $TCAA$ are the Total Current and Accrued Assets; and, $TCAL$ are the Total Current and Accrued Liabilities.

Net Income Divided by Operating Revenues (Profit Margin) =

$$\frac{NI}{TUOR}, \quad (D59)$$

where NI is the Net Income; and, $TUOR$ is the Total Utility Operating Revenues.

Electric Fixed Asset (Net Plant) Turnover =

$$\frac{EOR}{NEUP}, \quad (D60)$$

where EOR is the Electric Operating Revenues; and, $NEUP$ is the Net Electric Utility Plant (less nuclear fuel).

Internally Generated Funds to Cash Outflows for Plant =

$$\frac{\left(\begin{array}{c} NI + NCC + AOFUDC \\ - PSDD - CSDD \end{array} \right)}{COP} \times 100, \quad (D61)$$

where NI is Net Income; NCC is the Noncash Charges Credits (Depreciation and Depletion, Amortization, Deferred Income Taxes (Net), Investment Tax Credit Adjustment (Net), and "Other"); $AOFUDC$ is the Allowance for Other Funds Used During Construction; $PSDD$ is the Dividends Declared-Preferred Stock; $CSDD$ is the Dividends Declared-Common Stock; and, COP is the Cash Outflows for Plant.

Return on Average Common Stock Equity =

$$\frac{NI}{\frac{(TPC_B + TPC_E) - (PSI_B + PSI_E)}{2}} \times 100, \quad (D62)$$

where NI is the Net Income; TPC_B is the Total Proprietary Capital for the beginning of the year; TPC_E is the Total Proprietary Capital for the end of the year; PSI_B is the Preferred Stock Issued for the beginning of the year; and, PSI_E is the Preferred Stock Issued for the end of the year. An average for the year is calculated by dividing the sum by two.

Return on Investment =

$$\frac{NI}{TAOD} \times 100, \quad (D63)$$

where NI is the Net Income; and, $TAOD$ is the Total Assets and Other Debits.

Statement of Financial Accounting Standards

Accounting for the Effects of Certain Types of Regulation

Companies in regulated industries, such as electric utilities, are required to maintain several sets of accounting records. At least one set is needed to meet the needs of state and federal regulators, while an additional set is required to comply with generally accepted accounting principles (GAAP).

Not surprisingly, conflicts may arise between treatments required by different governing agencies. When

these differences do occur, the filings with regulators generally require the filer provide a schedule that reconciles the differences. In recognition of the substantial influence regulators can have on the financial performance of utilities, the Financial Accounting Standards Board (FASB) established special accounting treatments for these entities, i.e., SFAS No. 71. This accounting standard applies to general purpose financial statements when all of the following conditions exist:

- Rates are established by an independent third party (e.g., FERC) or by a governing board established by statute
- The rate structure is designed to recover the costs of providing services
- It is likely that the regulated costs will be recovered.

The accounting treatment afforded capitalized expenditures and associated costs is of greatest concern. Frequently, regulators require the capitalization of certain costs that have been incurred, while GAAP would require that these costs be expensed. To allow for this accounting treatment, SFAS No. 71 explicitly recognizes that certain costs may be capitalized that otherwise would have been expensed, but only if the following preconditions exist:

- It is probable that future revenues will at least equal the capitalized costs
- The revenue are intended to recover incurred costs, rather than anticipated future costs.

There is a possibility that a regulated company met the requirements of SFAS No. 71 in prior periods but no longer can meet the specific requirements and therefore should discontinue the use of SFAS No. 71. The FASB has specifically anticipated this potential and issued SFAS No. 101 to provide for the accounting for the discontinuation of SFAS No. 71. Effectively, SFAS No. 101 calls for the explicit accounting for any capitalized costs that resulted from the historical regulatory treatment. Further, any impairment or write-off of assets should be netted and included as income in the accounting period that the SFAS No. 71 is discontinued.

As the electric utility industry moves towards a more competitive market structure and approaches other than cost of service to determine future rates and revenue requirements, the continued application of SFAS No. 71 appears questionable. Further, write-offs of previously deferred costs would occur more likely in this changing environment.

Accounting for Abandonments and Disallowances of Plant Costs

According to the statement of the Financial Accounting Standards Board, SFAS No. 90 (issued in December 1987), when part of the cost of a completed plant is disallowed for ratemaking purposes and a reasonable estimate of the disallowance can be made, this estimated amount will be deducted from the cost of the plant as a loss. Several plants reported in this publication have been or are facing significant disallowances of costs. No attempt has been made to identify the plants or the amounts involved.

Accounting for Phase-in Plants

When the cost of new generating plants increase quite substantially and to the extent that conventional rate-making methods would result in significantly higher rates when the plant goes into service, some regulators have instituted phase-in plans to moderate the initial rate increase. In August 1987, the FASB issued SFAS No. 92 -- Regulated Enterprises. Phase-in plans were developed to moderate the initial increase in rates that would otherwise result from traditional treatment of plants entering commercial service by deferring some of the initial rate increase to future years and providing the electric utility with a return on investment for those deferred amounts provided the phase-in plan meets certain criteria. Assuming a electric utility is operating under a phase-in plan that met the criteria, the electric utility could continue to capitalize allowable deferred costs associated with a generating plant subsequent to the plant entering service. Therefore, the capital cost will continue to increase as these deferred costs are added to the cost of the plant. No attempt has been made to identify or segregate the costs associated with phase-in plans for the generating plants included in this report.

Statement of Cash Flows

Statement of Cash Flows, SFAS No. 95 (Financial Accounting Standards Board), became effective for annual financial statements for fiscal years ending after July 15, 1989. SFAS No. 95 requires that a cash flow statement replace the changes in the financial position statement as a part of the set of full financial statements.

SFAS No. 95 removes ambiguities of terms such as funds; comparability problems arising from diversity in statement focus (cash, cash and short-term investments, quick assets or working capital) and the resulting differences in definitions of funds flows from operating activities (cash or working capital); differences in format (sources and uses or activity format); variations in classification of items in an activity format; and, reports of net changes of assets and liabilities rather than gross inflows and outflows.

SFAS No. 95 requires a statement of cash flows that classifies cash receipts and payments according to whether they stem from operating, investing, or financial activities and provides definitions of each category. SFAS No. 95 requires the cash flow statement to explain the change in cash and cash equivalents,

where cash equivalents are short-term, highly liquid investments (e.g. investments with original maturities of three months or less).

SFAS No. 95 requires the electric utilities to report gross cash receipts and payments rather than net changes. These receipts and payments are to be classified into investing, financing or operating activities. SFAS No. 95 allows one of two methods for reporting - direct and indirect. The Federal Energy Regulatory Commission (FERC) issued Order No. 505, October 13, 1989, requiring electric utilities to use the indirect method which adjusts net income by reconciling it to net cash flow from operating activities. This reconciliation includes separately reporting all major classes of reconciling items.

Accounting for Income Taxes

FASB Statement No. 109, Accounting for Income Taxes, supersedes FASB Statement No. 96. Statement No. 109 establishes standards for the financial accounting and reporting for tax effects of an enterprise's activities. The Statement requires an enterprise to recognize the amount of taxes payable for the current period and the estimated amounts which are payable or deductible in future years for events that have been recognized in the enterprise's financial statements or tax returns. These estimated amounts which are to be recorded as deferred tax liabilities and/or deferred tax assets are attributable temporary differences: revenue, expenses, gains, or losses that are included in taxable income of an earlier or later year than the year in which they are recognized in financial income; other events that create differences between the tax basis of assets and liabilities and their amounts of financial reporting; and, operating loss or tax credit carrybacks for refunds of taxes paid in prior years and carry forwards to reduce taxes payable in the future.

Deferred tax liabilities and assets are measured annually and calculated using the current applicable tax laws and rates. A valuation allowance may need to be established when there is more than a 50 percent likelihood, that some portion of the deferred tax asset will not be realized.²

The Statement prohibits net-of-tax accounting and reporting and requires a deferred tax liability for tax benefits originating from temporary differences that are flowed through to consumers and for the equity component of the allowance for funds used during construction. An asset or liability must also be recognized for future revenue or reduction in revenue if it is probable that the resulting future increase or decrease in taxes payable will be recovered from or returned to consumers through future rate adjustments.

This Statement is effective for fiscal years beginning after December 15, 1992. Since the FASB has had

under consideration for a number of years to change accounting for income taxes, and a number of electric utilities have implemented the SFAS No. 96 accounting in prior years, the aggregated data reported in this publication contains a mixture of treatments.³ Since the application of SFAS No. 109 was not required before 1993 and prior year restatements not required, historical comparisons of the basic financial statements (e.g., balance sheet) are significantly complicated. The data in this publication are reported as submitted. Therefore, the reader is cautioned regarding interperiod comparisons of the aggregated data. Further, individual company comparisons must also take this into consideration.

Disclosures About Fair Value of Financial Instruments

Statements No. 107, effective for financial statements after December 15, 1992, sets forth disclosure requirements for financial instruments with off-balance sheet risk and/or credit risk.

Exempt from reporting requirements under this Statement are those obligations which fall under the requirements of other Statements issued by the FASB:

- Post-retirements benefits
- Substantively extinguished debt
- Insurance contracts
- Lease contracts
- Warranty obligations and rights
- Unconditional purchase obligations
- Investments accounted for under the equity method
- Equity investments on consolidated subsidiaries
- Equity instruments issued by the entity.

Financial instruments not recorded in the records of the entity may represent potential accounting losses, off-balance sheet credit, or market risk. Such financial instruments include futures contracts, interest rate swaps, forward purchase contracts, and guarantees for itself, a subsidiary, or other entity.

- Disclosures for Financial Instruments with Off-Balance Sheet Risk - Extent, Nature, and Terms:
 1. The contract, face, or notional amount of the financial instrument.
 2. A description of the financial instrument's nature and terms with disclosure of market and credit risks, cash requirements, and disclosures required under APB Opinion No. 22, as a minimum.⁴
- Financial Instruments with Credit Risks:

² This concept of a valuation allowance based on the likelihood of recovery did not appear in SFAS No. 96.

³ Accounts of those investor-owned electric utilities that implemented SFAS No. 96 could be determining reviewing the footnotes to financial statements (in the annual report to stockholders).

⁴ APB Opinion No. 22 requires the disclosure of all significant accounting policies used in the preparation of the financial statements.

1. The company's policy for financial instrument, collateral, nature, and description of such collateral and company access to the collateral.⁵
 2. The amount of accounting loss assuming that the counterparty to the contract defaults and any collateral related to the contract is of no value to the company.
- Disclosure for All Financial Instruments with Concentration of Credit Risks
1. All significant concentrations of credit risk including both individual and group concentrations.
 2. For each significant concentration of credit risk, disclose the economic characteristics, region, or activity that identifies the concentration.
 3. For each significant concentration of credit risk, disclose company policy for financial instrument collateral, nature, and description of such collateral and company access to the collateral.
 4. For each significant concentration of credit risk, the best estimate of the amount of accounting loss assuming that counterparties to the contracts making up the concentration default and any collateral related to the contracts is of no value to the company.

While on a company specific basis the accounting treatment afforded to these times may be significant, on an aggregate basis they would not appear to have a significant impact on interperiod comparisons.

Employers' Accounting for Postretirement Benefits Other Pensions

FASB Statement No. 106 requires a complex cost calculation for postretirement benefits similar to that which is required by Statement No. 87 for pension accounting. The Statement views postretirement benefits as a form of deferred compensation and may include such benefits as health care, legal service, day care, life insurance not included in pension benefits and tuition plans. The requirements of this Statement replace the pay-as-you-go approach used by most entities in accounting for postretirement benefits.

Effective for financial statements beginning after December 15, 1992 the cost of postretirement benefits must be calculated using seven basic components:

- Service cost
- Interest cost
- Amortization of prior service cost
- Actual return on plan assets
- Deferred asset gain or loss
- Amortization of gain or loss
- Amortization of transitional asset or obligation.

Although the financial statement impact appears limited, the administrative burden could be significant based on the number of postretirement programs available with an entity and the number of eligible employees.

General Information

Use of the Glossary

The terms in the glossary have been defined for general use. Restrictions on the definitions, as used in these data collection systems, are included in each definition when necessary to define the terms as they are used in this report.

Obtaining Copies of Data

Upon EIA approval of the *Financial Statistics of Major U.S. Investor-Owned Electric Utilities*, these data are available for public use.

Computer listings are obtained by submitting a written request to:

Energy Information Administration
Survey Management Division, EI-523
U.S. Department of Energy
1000 Independence Avenue, S.W.
Washington, DC 20585
(202) 254-5440 or FAX (202) 254-5765

Magnetic tapes may be purchased by using Visa, MasterCard, or American Express cards, as well as money orders or checks payable to the National Technical Information Service (NTIS). Purchasers may also use NTIS and Government Printing Office deposit accounts. To place an order, contact:

National Technical Information Service (NTIS)
Office of Data Base Services
U.S. Department of Commerce
5285 Port Royal Road
Springfield, Virginia 22161
(703) 487-4650 or FAX (703) 321-8547

Personal computer diskette (3 1/2" or 5 1/4") may be purchased by using Visa or MasterCard, as well as money orders or checks payable to the Superintendent of Documents. Purchasers may also use Government Printing Office deposit accounts. To place an order, contact:

Superintendent of Documents
U.S. Government Printing Office
Attn: Electric Products Sales Coordinator
P.O. Box 37080
Washington, DC 20013-7082
(202) 512-1530 or FAX (202) 512-1262

⁵ An enterprise may wish to disclose additional information about collateral underlying financial instruments, especially if the additional disclosure mitigates the credit risk.

Glossary

Accounting System. A method of recording accounting data for a utility or company or a method of supplying accounting information for controlling, evaluating, planning and decisionmaking.

Administrative and General Expenses. Expenses of an electric utility relating to the overall directions of its corporate offices and administrative affairs, as contrasted with expenses incurred for specialized functions. Examples include office salaries, office supplies, advertising, and other general expenses.

Allowance for Funds Used During Construction (AFUDC). A noncash item representing the estimated composite interest costs of debt and a return on equity funds used to finance construction. The allowance is capitalized in the property accounts and included in income.

Amortization. The gradual write-off of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized.

Asset. An economic resource, tangible or intangible, which is expected to provide benefits to a business.

Average Stream Flow. The rate, usually expressed in cubic feet per second, at which water passes a given point in a stream over a set period of time.

Capacity. The amount of electric power delivered or required for which a generator, turbine, transformer, transmission circuit, station, or system is rated by the manufacturer.

Capacity (Purchased). The amount of energy and capacity available for purchase from outside the system.

Capital. The equity interest of the owners consisting of common stock, preferred stock, and retained earnings in the entity, that is the difference between assets and liabilities.

Capital (Financial). The line items on the right side of a balance sheet, that include debt, preferred stock, and common equity. A net increase in assets must be financed by an increase in one or more forms of capital.

Capital Intensive. A condition in which investment in plant and equipment is relatively large compared to labor and to operation and maintenance expenses.

Capitalization. The long-term sources of funds comprising an entity's total capitalization; that is, the long-

term debt, preferred stock, and common equity. The short-term sources of capital are not included.

Capitalization Ratio. The percentage of debt, or preferred stock, or common stock, or other equity to the total capital structure of an entity.

Circuit. A conductor or a system of conductors through which electric current flows.

Circuit-Mile. The total length in miles of separate circuits regardless of the number of conductors used per circuit.

Classes of Service. Consumers grouped by similar characteristics in order to be identified for the purpose of setting a common rate for electric service. Usually classified into groups identified as residential, commercial, industrial and other.

Commercial. The commercial sector is generally defined as nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, retail stores, and health, social, and educational institutions. The utility may classify commercial service as all consumers whose demand or annual use exceeds some specified limit. The limit may be set by the utility based on the rate schedule of the utility.

Commercial and Industrial. Classes of service supplied to a similar grouping of consumers. These customer groupings are usually subdivided into smaller segments by classifying such consumers as commercial or industrial using the Federal Government's Office Of Management and Budget's Standard Industrial Classification Guide and/or a scale of energy usage as yardsticks; other consumers are reclassified as commercial or industrial when their demands or annual use exceeds some specified limit. These limits are generally based on a utility's rate schedules, except for those consumers who are supplied under special contracts or agreements calling for particular services.

Common Equity (Book Value). The retained earnings and common stock earnings plus the balances in common equity reserves and all other common stock accounts. This also includes the capital surplus, the paid-in surplus, the premium on common stocks, except those balances specifically related to preferred or preference stocks; less any common stocks held in the treasury.

Condenser Cooling Water. A source of water external to a boiler's feed system is passed through the steam leaving the turbine in order to cool and condense the steam. This reduces the steam's exit pressure and recaptures its heat, which is then used to preheat fluid entering the boiler, thereby increasing the plant's thermodynamic efficiency.

Conditionally Effective Rates. An electric rate schedule that has been put into effect by the FERC subject to refund pending final disposition or refileing.

Construction Costs (of the electric power industry). All direct and indirect costs incurred in acquiring and constructing electric utility plant and equipment and proportionate shares of common utility plant. Included are the cost of land and improvements, nuclear fuel and spare parts, allowance for funds used during construction, general overheads capitalized, less the cost of acquiring plant and equipment previously operated in utility service.

Construction Expenditures (of the electric power industry). The gross expenditures for construction costs, including the cost of replacing worn-out plants, and electric construction costs and land held for future use.

Construction Work In Progress (CWIP). The balance shown on a utility's balance sheet for construction work not yet completed but in process. This balance line item may or may not be included in the rate base.

Conventional Hydroelectric Plant. A plant in which all of the power is produced from natural streamflow as regulated by available storage.

Cooperative Electric Utility. An electric utility legally established to be owned by and operated for the benefit of those using its service. The utility company will generate, transmit, and/or distribute supplies of electric energy to a specified area not being serviced by another utility. Such ventures are generally exempt from Federal income tax laws. Most electric cooperatives have been initially financed by the Rural Electrification Administration, U.S. Department of Agriculture.

Cost. The amount paid to acquire resources, such as plant and equipment, fuel, or labor services.

Cost of Capital. The rate of return a utility must offer to obtain additional funds. The cost of capital varies with the leverage ratio, the effective income tax rate, conditions in the bond and stock markets, growth rate of the utility, its dividend strategy, stability of net income, the amount of new capital required, and other factors dealing with business and financial risks. It is a composite of the cost for debt interest, preferred stock dividends, and common stockholders' earnings that provide the facilities used in supplying utility service.

Cost of Debt. The interest rate paid on new increments of debt capital multiplied by 1 minus the tax rate.

Cost of Preferred Stock. The preferred dividend divided by the net price of preferred stock.

Cost of Retained Earnings. The residual of a utility's earnings over expenditures, including taxes and dividends, that are reinvested in its business. The cost of these funds is always lower than the cost of new

equity capital, due to taxes and transactions costs. Therefore, the cost of retained earnings is the yield that retained earnings accrue upon reinvestment.

Cost of Service. A ratemaking concept used for the design and development of rate schedules to ensure that the filed rate schedules recover only the cost of providing the electric service at issue. These costs include operating and maintenance expenses, depreciation and amortization expenses, and income and other taxes found just and reasonable by the regulatory agency for ratemaking purposes plus, in the case of privately owned electric utilities, an allowance for a return on capital (usually computed by applying a rate of return to the rate base). This concept attempts to equate the cost incurred by the utility to the revenue received for the service provided to each of the consumer classes.

Current Assets. Cash and other assets that are expected to be turned into cash, sold, or exchanged within the normal operating cycle of the utility, usually one year. Current assets include cash, marketable securities, receivables, inventory and current prepayments.

Current Liabilities. A debt or other obligation that must be discharged within one year or the normal operating cycle of the utility by expending a current asset or the incurrence of another short-term obligation. Current liabilities included account payable, short-term notes payable, and accrued expenses payable such as taxes and salaries payable.

Current Ratio. The ratio of current assets divided by current liabilities that shows the ability of a utility to pay its current obligations from its current assets. A measure of liquidity, the higher the current ratio, the more assurance that current liabilities can be paid.

Debt. Money or services owed through a legal obligation to an outside party. Debt may be classified short-term which is one year or less or long-term which is more than one year.

Deferred Cost. An expenditure not recognized as a cost of operation of the period in which incurred, but carried forward to be written off in future periods.

Deferred Fuel Costs. An expenditure for fuel that is not recognized for bookkeeping practices as a cost in the operating period incurred, but carried forward to be written off in future periods.

Deferred Income Tax (Liability). A liability in the balance sheet representing the additional Federal income taxes that would have been due if a utility had not been allowed to compute tax expenses differently for income tax reporting purposes than for ratemaking purposes.

Depreciation. Charges made against income for distributing the cost of a tangible asset, so as to allocate it systematically across the period in which the asset is used.

Design Head. The achieved river, pondage, or reservoir surface height (forebay elevation) that provides the water level to produce the full flow at the gate of the turbine in order to attain the manufacturer's installed nameplate rating for generation capacity.

Diesel-Electric Plant. A generating station that uses diesel engines to drive its electric generators.

Distribution System. The portion of an electric system that is dedicated to delivering electric energy to an end user.

Docket. A formal record of a Federal Energy Regulatory Commission proceeding. These records are available for inspection and copying by the public. Each individual case proceeding is identified by an assigned number.

Economy of Scale. The principle that larger production facilities have lower unit costs than smaller facilities.

Electric Expenses. The cost of labor, material, and expenses incurred in operating a facility's prime movers, generators, auxiliary apparatus, switching gear, and other electric equipment for each of the points where electricity enters the transmission or distribution grid.

Electric Operating Expenses. Summation of electric operation-related expenses, such as operation expenses, maintenance expenses, depreciation expenses, amortization, taxes other than income taxes, Federal income taxes, other income taxes, provision for deferred income taxes, provision for deferred income-credit, and investment tax credit adjustment.

Electric Plant (Financial). Assets comprising land, building, and equipment permanently employed.

Electric Power Industry. The privately, publicly, federally and cooperatively owned electric utilities of the United States taken as a whole. This includes all electric systems serving the public: regulated investor-owned electric utility companies; Federal power projects; State, municipal, and other government-owned systems, including electric public utility districts; electric cooperatives, including generation and transmission entities. Excluded from this definition are the special purpose electric facilities or systems that do not offer service to the public.

Electric Power System. An individual electric power entity -- a company, an electric cooperative, a public electric supply corporation as the Tennessee Valley Authority, a similar Federal department or agency as the Bonneville Power Administration, the Bureau of Reclamation or the Corps of Engineers, a municipally owned, electric department offering service to the public, or an electric public utility district (a "PUD"); also a jointly owned electric supply project such as the Keystone.

Electric Rate Schedule. A statement of the electric rate and the terms and conditions governing its appli-

cation, including attendant contract terms and conditions that have been accepted by a regulatory body with appropriate oversight authority.

Electric Utility. A corporation, person, agency, authority, or other legal entity or instrumentality that owns and/or operates facilities within the United States, its territories, or Puerto Rico for the generation, transmission, distribution, or sale of electric energy primarily for use by the public and files forms listed in the Code of Federal Regulations, Title 18, Part 141. Facilities that qualify as cogenerators or small power producers under the Public Utility Regulatory Policies Act (PURPA) are not considered electric utilities.

Electrical System Energy Losses. The amount of energy lost during generation, transmission, and distribution of electricity, including plant and unaccounted for use.

End User. The final consumer of electricity.

Energy. The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic energy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatthours, while heat energy is usually measured in British thermal units.

Energy Deliveries. Energy generated by one electric utility system and delivered to another system through one or more transmission lines.

Energy Information Administration (EIA). An independent agency within the U.S. Department of Energy that develops surveys, collects energy data, and does analytical and modeling analyses of energy issues. The Agency must satisfy the requests of Congress, other elements within the Department of Energy, Federal Energy Regulatory Commission, the Executive Branch, its own independent needs, and assist the general public, or other interest groups, without taking a policy position.

Energy Loss. The difference between energy input and output as a result of transfer of energy between two points.

Energy Receipts. Energy generated by one electric utility system and received by another system through one or more transmission lines.

Equity (Financial). Ownership of shareholders in a corporation represented by stock.

Equity Capital. The sum of capital from retained earnings and the issuance of stocks.

Expenditure. The incurrence of a liability to obtain an asset or service.

Federal Electric Utility. A utility that is either owned or financed by the Federal Government.

Federal Energy Regulatory Commission (FERC). A quasi-independent regulatory agency within the Department of Energy having jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification.

Federal Power Act. Enacted in 1920, and amended in 1935, the Act consists of three parts. The first part incorporated the Federal Water Power Act administered by the former Federal Power Commission, whose activities were confined almost entirely to licensing non-Federal hydroelectric projects. Parts II and III were added with the passage of the Public Utility Act. These parts extended the Act's jurisdiction to include regulating the interstate transmission of electrical energy and rates for its sale as wholesale in interstate commerce. The Federal Energy Regulatory Commission is now charged with the administration of this law.

Federal Power Commission. The predecessor agency of the Federal Energy Regulatory Commission. The Federal Power Commission (FPC) was created by an Act of Congress under the Federal Water Power Act on June 10, 1920. It was charged originally with regulating the electric power and natural gas industries. The FPC was abolished on September 20, 1977, when the Department of Energy was created. The functions of the FPC were divided between the Department of Energy and the Federal Energy Regulatory Commission.

FERC. The Federal Energy Regulatory Commission.

FERC Guidelines. A compilation of the Federal Energy Regulatory Commission's enabling statutes, procedural and program regulations, and orders, opinions and decisions.

Financial Accounting Standards Board (FASB). An independent board responsible, since 1973, for establishing generally accepted accounting principles. Its official pronouncements are called "Statements of Financial Accounting Standards" and "Interpretations of Financial Accounting Standards."

Fiscal Year. A financial year based on a predetermined starting date. The Federal Government's financial year runs from October 1 through September 30.

Fixed Asset Turnover. A ratio of revenue to fixed assets which is a measure of the productivity and efficiency of property, plant, and equipment in generating revenue. A higher turnover reflects positively on the entity's ability to utilize properly its fixed assets in business operations.

Fixed Assets. Tangible property used in the operations of an entity, but not expected to be consumed or converted into cash in the ordinary course of events. With a life in excess of one year, not intended for resale to customers, and subject to depreciation (with the exception of land), they are usually referred to as property, plant, and equipment.

Fixed Charge Coverage. The ratio of earnings available to pay so-called fixed charges to such fixed charges. Fixed charges include interest on funded debt, including leases, plus the related amortization of debt discount, premium and expense. Earnings available for fixed charges may be computed before or after deducting income taxes. Occasionally credits for the "allowance for fund used during construction" are excluded from the earnings figures. The precise procedures followed in calculating fixed charge or interest coverages vary widely.

Fixed Cost (expense). An expenditure or expense that does not vary with volume level of activity.

Fixed Operating Costs. Costs other than those associated with capital investment that do not vary with the operation, such as maintenance and payroll.

Fossil Fuel. Any naturally occurring organic fuel, such as petroleum, coal, and natural gas.

Fossil-Fuel Plant. A plant using coal, petroleum, or gas as its source of energy.

Fuel Expenses. These costs include the fuel used in the production of steam or driving another prime mover for the generation of electricity. Other associated expenses include unloading the shipped fuel and all handling of the fuel up to the point where it enters the first bunker, hopper, bucket, tank, or holder in the boiler-house structure.

Gas Turbine Plant. A plant in which the prime mover is a gas turbine. A gas turbine consists typically of an axial-flow air compressor, one or more combustion chambers, where liquid or gaseous fuel is burned and the hot gases are passed to the turbine and where the hot gases expand to drive the generator and are then used to run the compressor.

Generally Accepted Accounting Principles (GAAP). Defined by the FASB as the conventions, rules, and procedures necessary to define accepted accounting practice at a particular time; includes both broad guidelines and relatively detailed practices and procedures.

Generating Unit. Any combination of physically connected generator(s), reactor(s), boiler(s), combustion turbine(s), or other prime mover(s) operated together to produce electric power.

Generator Nameplate Capacity. The full-load continuous rating of a generator, prime mover, or other electric power production equipment under specific conditions as designated by the manufacturer. Installed generator nameplate rating is usually indi-

cated on a nameplate physically attached to the generator.

Geothermal Plant. A plant in which the prime mover is a steam turbine. The turbine is driven either by steam produced from hot water or by natural steam that derives its energy from heat found in rocks or fluids at various depths beneath the surface of the earth. The energy is extracted by drilling and/or pumping.

Grid. The layout of an electrical distribution system.

Gross Generation. The total amount of electric energy produced by a generating facility, as measured at the generator terminals.

Head. The product of the water's weight and a usable difference in elevation gives a measurement of the potential energy possessed by water.

Historical Plant Cost of Equipment. The charges for equipment assigned to power production include: the net purchased price thereof; sales taxes; investigation and inspection expenses necessary for such purchases, any expenses of transportation when borne by the utility; labor employed charges; materials and supplies consumed; and expenses incurred by the utility in unloading and placing the equipment in readiness to operate.

Historical Plant Cost of Land and Land Rights. The cost of land purchased or the fees paid by the utility for rights, interests, and privileges to be held by the utility in land owned by others. The types of rights acquired include leaseholds, easements, water and water power rights, rights-of-way, and other like interests.

Historical Plant Cost of Structures and Improvements (Expenses). The cost of all buildings and facilities to house, support, or safeguard property or persons, including all fixtures permanently attached to and made a part of building. Also includes the cost incurred in connection with the first clearing and grading of land and rights-of-ways.

Holding Company. A company that confines its activities to owning stock in, and supervising management of, other companies. The Securities and Exchange Commission, as administrator of the Public Utility Holding Company Act of 1935, defines a holding company as "a company which directly or indirectly owns, controls or holds 10 percent or more of the outstanding voting securities of a holding company" (15 USC 79b, par. a (7)).

Hydroelectric Energy. The production of electricity from kinetic energy in flowing water.

Hydroelectric Plant. A plant in which the turbine generators are driven by falling water.

Hydroelectric Plant Capacity. This capacity figure is a function of fluid flow losses, hydraulic turbines,

head, and water flow. The minimum net head limits the firm capacity of the plant.

Hydroelectric Power. The harnessing of flowing water to produce mechanical or electrical energy.

Independent Power Producer. A corporation, person, agency, authority, or other legal entity or instrumentality that owns electric generating capacity and is a wholesale electric producer without a designated franchised service area. The entity is not a qualifying facility as defined in the Public Utility Regulatory Policies Act of 1978.

Industrial. The industrial sector is generally defined as manufacturing, construction, mining, agriculture, fishing and forestry establishments Standard Industrial Classification (SIC) codes 01-39. The utility may classify industrial service using the SIC codes, or based on demand or annual usage exceeding some specified limit. The limit may be set by the utility based on the rate schedule of the utility.

Instantaneous Peak Demand. The maximum demand at the instant of greatest load.

Interchange Energy. Kilowatthours delivered to or received by one electric utility or pooling system from another. Settlement may be by payment, returned in kind at a later time or accumulated as energy balances until the end of the stated period.

Interconnection. Two or more electric systems having a common transmission line that permits a flow of energy between them. The physical connection of the electric power transmission facilities allows for the sale or exchange of energy.

Interdepartmental Service (Electric). Interdepartmental service includes amounts charged by the electric department at tariff or other specified rates for electricity supplied by it to other utility departments.

Interest Coverage Ratio. The number of times that fixed interest charges were earned. It indicates the margin of safety of interest on fixed debt. The times-interest-earned ratio is calculated using net income before and after income taxes; and the credits of interest charged to construction being treated as other income. The interest charges include interest on long-term debt, interest on debt of associated companies, and other interest expense.

Interlocking Directorates. The holding of a significant position in management or a position on the corporate board of a utility, while simultaneously holding a comparable position with another utility, or with a firm doing business with the utility.

Internal Combustion Plant. A plant in which the prime mover is an internal combustion engine. An internal combustion engine has one or more cylinders in which the process of combustion takes place, converting energy released from the rapid burning of a fuel-air mixture into mechanical energy. Diesel or gas-fired engines are the principal types used in electric

plants. The plant is usually operated during periods of high demand for electricity.

Investor-Owned Electric Utility. A class of utility that is investor owned and organized as a tax paying business, usually financed by the sales of securities in the capital market.

Kilowatt (kW). One thousand watts.

Kilowatthour (kWh). One thousand watthours.

Leverage Ratio. A measure that indicates the financial ability to meet debt service requirements and increase the value of the investment to the stockholders. (i.e. the ratio of total debt to total assets).

Liability. An amount payable in dollars or by future services to be rendered.

Licensees. Entity that has been granted permission to engage in an activity otherwise unlawful (i.e. hydropower project).

Line Loss. Energy kilowatthours lost in transmission and distribution lines.

Load (Electric). The amount of electric power delivered or required at any specific point or points on a system. The requirement originates at the energy-consuming equipment of the consumers.

Long-term Debt. Debt securities or borrowings having a maturity of more than one year.

Maintenance Expenses. That portion of operating expenses consisting of labor, materials, and other direct and indirect expenses incurred for preserving the operating efficiency and/or physical condition of utility plants used for power production, transmission, and distribution of energy.

Maximum Demand. The greatest of all demands of the load that has occurred within a specified period of time.

Mcf. One thousand cubic feet.

Megawatt (MW). One million watts.

Megawatthour (MWh). One million watthours.

Mill. A monetary cost and billing unit used by utilities; it is equal to 1/1000 of the U.S. dollar (equivalent to 1/10 of 1 cent).

Multiple Purpose Reservoir. Stored water and its usage governed by advanced water resource conservation practices to achieve more than one water control objective. Some of the objectives include flood control, hydro- electric power development, irrigation, recreation usage, and wilderness protection.

Municipality. (As defined in section 3, paragraph (7) of the Federal Power Act, P.L. 66-280 as amended) A city, county, irrigation district, drainage district, or

other political subdivision or agency of a State competent under the laws thereof to carry on the business of developing, transmitting, utilizing, or distributing power (41 Stat. 1064; 49 Stat. 838; 16 U.S.C. 796(7)).

Net Generation. Gross generation minus plant use from all electric utility owned plants. The energy required for pumping at a pumped-storage plant is regarded as plant use and must be deducted from the gross generation.

Net Income. The excess of all revenues and gains for a period over all expenses and losses of the period.

Nonutility Power Producer. A corporation, person, agency, authority, or other legal entity or instrumentality that owns electric generating capacity and is not an electric utility. Nonutility power producers include qualifying cogenerators, qualifying small power producers, and other nonutility generators (including independent power producers) without a designated franchised service area, and which do not file forms listed in the Code of Federal Regulations, Title 18, Part 141.

Nuclear Fuel. Fissionable materials that have been enriched to such a composition that, when placed in a nuclear reactor, will support a self-sustaining fission chain reaction, producing heat in a controlled manner for process use.

Nuclear Power Plant. A facility in which heat produced in a reactor by the fissioning of nuclear fuel is used to drive a steam turbine.

Nuclear Reactor. An apparatus in which the nuclear fission chain can be initiated, maintained, and controlled so that energy is released at a specific rate. The reactor includes fissionable material (fuel), such as uranium or plutonium; fertile material; moderating material (unless it is a fast reactor); a heavy-walled pressure vessel; shielding to protect personnel; provision for heat removal; and control elements and instrumentation.

Ohm. The unit of measurement of electrical resistance. The resistance of a circuit in which a potential difference of 1 volt produces a current of 1 ampere.

Operating Expenses. Expenses related to utility operations, which include operation and maintenance expenses, provisions for depreciation and amortization, taxes other than income taxes, income taxes, provision for deferred income taxes, income taxes deferred in prior years-- credit and investment tax credit adjustments--net.

Operating Income. Operating revenues less operating expenses.

Operation Expenses. The components of power production expenses that incur cost for operations that are directly related to producing electricity. The major item is almost always fuel that has to be burned to generate the electricity.

Operation Supervision and Engineering (Expenses). These expenses include the cost of labor and expenses incurred in the general supervision and direction of the operation of power generation stations. The supervision and engineering costs consist of the pay and expenses of staff and consultants engaged in supervising and directing the operation of each utility function. Direct supervision and engineering of activities, such as fuel handling, boiler room operations, and generator operations, are charged to the appropriate accounts.

Original Cost. The initial amount of money spent to acquire an asset. It is equal to the price paid, or present value of the liability incurred, or fair value of stock issued, plus normal incidental costs necessary to put the asset into its initial use.

Other Generation. Electricity originating from these sources: biomass, fuel cells, geothermal heat, solar power, waste, wind, and wood.

Owner's Equity. Interest of the owners in the assets of the business represented by capital contributions and retained earnings.

Parent Company. Company owning more than 50 percent of the voting shares of another company, called the subsidiary.

Plant. A facility at which are located prime movers, electric generators, and auxiliary equipment for converting mechanical, chemical, and/or nuclear energy into electric energy. A plant may contain more than one type of prime mover. Electric utility plants exclude facilities that satisfy the definition of a qualifying facility under the Public Utility Regulatory Policies Act of 1978.

Plant-Use Electricity. The electric energy used in the operation of a plant. This energy total is subtracted from the gross energy production of the plant; for reporting purposes the plant energy production is then reported as a net figure. The energy required for pumping at pumped-storage plants is, by definition, subtracted, and the energy production for these plants is then reported as a net figure.

Pole-Mile. A unit of measuring the simple length of a transmission line carrying electric conductors, without regard to the number of conductors carried.

Power. The rate at which energy is transferred. Electrical energy is usually measured in watts. Also used for a measurement of capacity.

Power (Electrical). An electric measurement unit of power called a voltampere is equal to the product of 1 volt and 1 ampere. This is equivalent to 1 Watt for a direct current system and a unit of apparent power is separated into real and reactive power. Real power is the work-producing part of apparent power that measures the rate of supply of energy and is denoted as Kilowatts (KW). Reactive power is the portion of apparent power that does no work and is referred to as kilovars; this type of power must be supplied to

most types of magnetic equipment, such as motors, and is supplied by generator or by electrostatic equipment. Voltamperes are usually divided by 1,000 and called kilovoltamperes (kVA). Energy is denoted by the product of real power and the length of time utilized; this product is expressed as kilowatthours.

Power Production Plant. All the land and land rights, structures and improvements, boiler or reactor vessel equipment, engines and engine-driven generator, turbogenerator units, accessory electric equipment, and miscellaneous power plant equipment are grouped together for each individual facility.

Preferred Stock. Ownership interests in a corporation which have been granted a preference, usually in the distribution of dividends before payment of dividends to common stockholders and assets in dissolution. It is usually nonvoting.

Price. The amount of money or consideration-in-kind for which a service is bought, sold, or offered for sale.

Prime Mover. The motive force that drives an electric generator (e.g., steam engine, turbine, or water wheel).

Production (Electric). Act or process of producing electric energy from other forms of energy; also, the amount of electric energy expressed in watthours (Wh).

Production Expenses. Costs incurred in the production of electric power that conform to the accounting requirements of the Operation and Maintenance Expense Accounts of the FERC Uniform System of Accounts.

Profit. The income remaining after all business expenses are paid.

Public Authority Service to Public Authorities. Public authority service includes electricity supplied and services rendered to municipalities or divisions or agencies of State or Federal governments, under special contracts or agreements or service classifications applicable only to public authorities.

Public Street and Highway Lighting. Public street and highway lighting includes electricity supplied and services rendered for the purposes of lighting streets, highways, parks, and other public places; or for traffic or other signal system service, for municipalities, or other divisions or agencies of State or Federal governments.

Public Utility District. Municipal corporations organized to provide electric service to both incorporated cities and towns and unincorporated rural areas. Public utility districts, sometimes called "People's Utility Districts" or "Public Power Districts," operate in six States.

Pumped-Storage Hydroelectric Plant. A plant that usually generates electric energy during peak-load periods by using water previously pumped into an ele-

vated storage reservoir during off-peak periods when excess generating capacity is available to do so. When additional generating capacity is needed, the water can be released from the reservoir through a conduit to turbine generators located in a power plant at a lower level.

Purchased Power. Power purchased or available for purchase from a source outside the system.

Railroad and Railway Services. Railroad and railway services include electricity supplied and services rendered to railroads and interurban and street railways, for general railroad use, including the propulsion of cars or locomotives, where such electricity is supplied under separate and distinct rate schedules.

Rate Base. The value of property upon which a utility is permitted to earn a specified rate of return as established by a regulatory authority. The rate base generally represents the value of property used by the utility in providing service and may be calculated by any one or a combination of the following accounting methods: fair value, prudent investment, reproduction cost, or original cost. Depending on which method is used, the rate base includes cash, working capital, materials and supplies, and deductions for accumulated provisions for depreciation, contributions in aid of construction, customer advances for construction, accumulated deferred income taxes, and accumulated deferred investment tax credits.

Ratemaking Authority. A utility commission's legal authority to fix, modify, approve, or disapprove rates, as determined by the powers given the commission by a State or Federal legislature.

Rate of Return. The ratio of net operating income earned by a utility is calculated as a percentage of its rate base.

Rate of Return on Rate Base. The ratio of net operating income earned by a utility calculated as a percentage of its rate base.

Refunding. Retirement of one security issue with proceeds received from selling another. Refunding provides for retiring maturing debt by taking advantage of favorable money market conditions.

Regulation. The governmental function of controlling or directing economic entities through the process of rulemaking and adjudication.

Residential. The residential sector is defined as private household establishments which consume energy primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking and clothes drying. The classification of an individual consumer's account, where the use is both residential and commercial, is based on principal use. For the residential class, do not duplicate consumer accounts due to multiple metering for special services (water, heating, etc.). Apartment houses are also included.

Retail. Sales covering electrical energy supplied for residential, commercial, and industrial end-use purposes. Other small classes, such as agriculture and street lighting, also are included in this category.

Retail Wheeling. An arrangement in which a utility transmits electricity from outside its service territory to a retail customer within its customer service territory.

Retained Earnings. The balance, either debit or credit, of appropriated or unappropriated earnings of an entity that are retained in the business.

Return on Common Equity. The net income less preferred stock dividends divided by the average common stock equity.

Return on Common Stock Equity. An entity's earnings available for common stockholders calculated as a percentage of its common equity capital.

Revenue. The total amount of money received by a firm from sales of its products and/or services, gains from the sales or exchange of assets, interest and dividends earned on investments, and other increases in the owner's equity except those arising from capital adjustments.

Revenue Requirement. The total revenue that the utility is authorized an opportunity to recover, which includes operating expenses and a reasonable return on rate base.

Rural Electrification Administration (REA). A lending agency of the U.S. Department of Agriculture, the REA makes self-liquidation loans to qualified borrowers to finance electric and telephone service to rural areas. The REA also finances the construction and operation of generating plants, electric transmission and distribution lines, or systems for the furnishing of initial and continued adequate electric services to persons in rural areas not receiving central station service.

Sales. The amount of kilowatthours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. Other sales include public street and highway lighting, other sales to public authorities and railways, and interdepartmental sales.

Sales for Resale. Energy supplied to other electric utilities, cooperatives, municipalities, and Federal and State electric agencies for resale to ultimate consumers.

Short-term Debt or Borrowings. Debt securities or borrowings having a maturity of less than one year.

Solar Energy. Energy produced from the sun's radiation.

Steam-Electric Plant (Conventional). A plant in which the prime mover is a steam turbine. The steam used to

drive the turbine is produced in a boiler where fossil fuels are burned.

Steam Expenses. The cost of labor, materials, fuel, and other expenses incurred in production of steam for electric generation.

Steam from other Sources. Steam purchased, transferred from another department of the utility, or acquired from others under a joint-facility operating agreement.

Steam Transferred-Credit. The expenses of producing steam charged to others or to other utility departments under a joint operating arrangement.

Substation. Facility equipment that switches, changes, or regulates electric voltage.

Switching Station. Facility equipment used to tie together two or more electric circuits through switches. The switches are selectively arranged to permit a circuit to be disconnected, or to change the electric connection between the circuits.

System (Electric). Physically connected generation, transmission, and distribution facilities operated as an integrated unit under one central management, or operating supervision.

Transformer. An electrical device for changing the voltage of alternating current.

Transmission. The movement or transfer of electric energy over an interconnected group of lines and associated equipment between points of supply and points at which it is transformed for delivery to consumers, or is delivered to other electric systems. Transmission is considered to end when the energy is transformed for distribution to the consumer.

Transmission System (Electric). An interconnected group of electric transmission lines and associated equipment for moving or transferring electric energy in bulk between points of supply and points at which it is transformed for delivery over the distribution system lines to consumers, or is delivered to other electric systems.

Turbine. A machine for generating rotary mechanical power from the energy of a stream of fluid (such as water, steam, or hot gas). Turbines convert the kinetic energy of fluids to mechanical energy through the principles of impulse and reaction, or a mixture of the two.

Ultimate Consumer. A consumer that purchases electricity for its own use and not for resale.

Uniform System of Accounts. Prescribed financial rules and regulations established by the Federal Energy Regulatory Commission for utilities subject to its jurisdiction under the authority granted by the Federal Power Act.

Utility Generation. Generation by electric systems engaged in selling electric energy to the public.

Watt. The electrical unit of power. The rate of energy transfer equivalent to 1 ampere flowing under a pressure of 1 volt at unity power factor.

Watthour (Wh). An electrical energy unit of measure equal to 1 watt of power supplied to, or taken from, an electric circuit steadily for 1 hour.

Wheeling Service. The movement of electricity from one system to another over transmission facilities of intervening systems. Wheeling service contracts can be established between two or more systems.
