## CHAPTER I

INTRODUCTION

Reading is demanded of the child almost hourly in his school work; if he fails in reading, he will experience failure in practically every other field. To be a welladjuated child, and later well-integrated adult, the individual needs to read skillfully at ovory school leval. It is aignificant that a large proportion of juvenile delinquency cases have also proved to be remedial-reading problems.

Any phase of life which so profaundly influences the child raerits the most caroful study by all who work with children. It demands the use of techniques that have been tested and have proved their practical value in the classroom.

Reading is the basis of all our study; therefore, it is fraportant that elementary school stuaents attain the highest possible degree of ability. Not only is the abllity to read Important, but the ability to underatand and interpret the material read is also of paramount significance.

Statement of the Problem
In the experiments and findings in literature one constantly sees references to the "well known superiority of gixls in subjecta involving language, such as reading.
gramar, and literature." The problem of this atudy is to deternine how the reading ability of boys in the third grade of the Graham elementary school compares with the reading abllity of the eirls in the same grade. The problen is concerned with four phases of the reading scope.

## Purpose

For eighty years psychologists have investieated problems touching upon reading ability. It is the purpose of this study to determine if there is any significant difference in the reading ability of boys and girls in the third grade. If such differences ere found to exist, an attempt will be made to explain the cause.

Sources of Data
The major source of data came from the teata administered to the boys and girls of the third grade of the Graham, Texas, Elemontary School. Data were also gathered fron books in the fiald of education, current magazine articles, and trade publications available through the libraries of the North Texas State College and the Texas State College for Women, Donton, Texas.

## Limitations

The present study was confined to a study of the boys and cirls enrolled in the third grade of the Grahan, Texas, Elementary School during the school year 1949-50. The study
w111 consider only the results of a standardized test administered as part of the regular classroom routine.

## Procedure

The boys and gixls of the third grade were given The Melson Silent Resding Rest. ${ }^{1}$ These teats are designed to serve as a neasure of the reauing ability of pupils in the third to ninth grade, inclusive, and to serve as alagnostic instrument for determining pupil difficulties. The test consists of two parts, a vocabulary test and a paragraph test. The vocabulary test consists of one hundred words in fiveresponse type, while the paragraph test consists of twentyIVe paragraphs, each followed by three questions concerning the contents of the paragraph; the questions are in the four-response form.

The paxagraph test measures three phaseg of roading ability: ability to understand the general aignificance of a paragraph, ability to denote aetails, and ability to predict probable outcome. These teats were acored, and boys and girls paired for the purpose of compsirison. Pairing was based on organismic age. Scores on each phase of the test were recorded, compared and analyzed to determine if any differencea did exist.

[^0]Review of Related studies
A great daal has been written concerning reading. Fowever, the majority of the work has been in the field of reading content rather than in the field of reading ability.

Kopel found that in his particular school perhaps 90 per cent of the readinc disability casea were of nethodological origin. 2 Inadequate provision for individual differences at the primary level seamed to be the cause of fanlure.

According to the investigation of Harris, in most schools the children show an astonishingly wide difference in reading ability. He found that it was not umasual to discover In the upper elementary grades some children who are still reading at the primary levels, while others are superior to the hieh school seniors. 3 Naturally this situation creates a serious educational problem. He suns up his study by saying

*     * Most cases of readre disabllities ariso from such causes as montal or social insecurity, sensory handicaps, poor motivation, frequent and prolonged absence from school and exposure to ineffective and inefilcient teaching. 4

If there be a reading disability, the fixst job is to find out "twhy" For many yoars oducators thought a child

[^1]who was unable to read was elther lazy or atupid. Thon, by the use of intelligence tests it was discovered that many bright, Intelligent children could not read, although they could underatand what was read to them. 5 Causes for a child not belns able to read are clasainied into four groupe: physical, intelloctual, eaotional, and educational. 6 Wany children are retarded because they are not ready for reading. Poor instruction in early years tenas to make rotamded readers. 7 Constant prodaing and scolaing only ad to the child's difficultas.

Low intelligence is maintained by most authors of psychology of reading as a possible contributing factor in reading retardation. Psychologists recommend that some measure of mental capacity be secured for any given case of reading ability. Here again the fact is pointed out that many tasts are unsuitable bocause of the reador's Insuffim cient ability in reading fundamentals. 8

Provious investications have indicated that roading ability and mental ability are highly correlated and support

the assumption that whatever influences the development of one may influence that of the other. 9 hany tests are unsuitable because of their printed form. A child with a nigh I. Q. may have a low score because of poor reading. 10

A fairly consistent finding in the elementary grades is that giris are better than boys on the average in readm ing comprehension, vocabulary, and basic language skilla. From laboratory expeximents, olson found that age for age gixls regularly exceeded the boys in eight out of ton comparisons. 11

Gelleman reported only sixty cases of reading difficulty. He found that about 31 ber cent of the cases had intelligence quotients below normal (90) while 33.3 per cent of the cases were above nomal (110). The remaining 35.7 were within a normal range. 12 The conclusion drawn was that the rajority of reading difficulties ksi not due to low intalligence but primarily to instructional prograns not adjusted to the individual needs. 13

## CHAPLaR TI

## EQUATION Qe STODETYS ON BASIS OR OROMNISTIC AOE

The first step in setting up atudy to compare the readIng ability of boys with the reading ability of girls was to determine a basis for conparison. Decause of sex cifferonces, rate of maturity, and intorests, a comparison of only the reading grades of boys with those of ginls would be pointless. Therefore, in order to compars nore accurately the reading ability of boys with the reading ability of girla, from an onrollucat of 120 students, thirty boys and thirty giris were chosen on the basis of organiamic ages for comparison.

The boys and girls in the thixd grade of the Graham, Texas, Elementary School were first paired on the basis of organismic age. In comparing the intelligence quotients of the pairs selected by organismic ages, it was found that the intelligence quotients of several pairs varied as much as ninety pointa. By elininatine those pairs whose intelligence quotients varied more than elghteen points, thirty pairs ware obtained. The organismic ages of the thirty pairs varied by no more than 2 of a point and the intelligence quotients varied by no more than eighteen points.

The organismic age and intelligence quotient for each of the boys and girls used in this study are shown in Table 1.

| 21 | 8.1 | 91 | 21. | 8.2 | 92 |
| 22 | 9.7 | 104 | 22 | 9.7 | 109 |
| 23 | 9.3 | 104 | 23 | 9.3 | 97 |
| 24 | 9.3 | 103 | 24 | 9.2 | 92 |
| 25 | 8.9 | 107 | 25 | 8.9 | 90 |
| 26 | 9.0 | 85 | 26 | 9.0 | 88 |
| 27 | 7.9 | 76 | 27 | 8.1 | 92 |
| 28 | 9.4 | 107 | 28 | 9.4 | 105 |
| 29 | 0.5 | 114 | 29 | 9.5 | 110 |
| 30 | 8.5 | 89 | 30 | 8.5 | 75 |

Organdamic ages for both boys and girls ranged from a Low of 7.9 to a high of 10.6 . For the girla, the rance was from 7.9 , reported by pupil No. 6, to 10.4 , reported by
pupil No. 11. The mean organismic age for the girls, for the boys, and for the entire group wad 9.7 .

Intelligence quotients for the firls ranged from a low of seventy-six reported by pupil wo. 27 to a high of 122 reported by pupil 10. . Fox the boys, intelligence quotients ranged froa seventy-five reported by pupll No. 30 to 124 reported by pupil No. 12. The mean intalligenco quotiont for the girls was ninety-three; for the boys it was 101; and for the ontire group it was ninety-six.

Twelve girls and fifteen boys had intelligence quotients below the mean for the group. Twenty-four girls had intelligence quotients above the mean for the girls while fourteen boys had intolligence quotienta above the mean for their group.

The most important function of a test lies in the fact that a singlo administration of the test in a class provides the teacher whe rather exact notion of the level of development of the several olaments of milent reading ability in the class as well as with specific informaiton concerning the limitations of the individuals comprising the class. By comparing the results obtained from a class Wth the accompanying norms, a claar concept of the general ability of the class in silent reading of the work-stuay type can be obtained. By analyzing the scores made by individual pupils on the various parts of the test, the specific weakneases or strengths of individual pupils may be discovered.

After the intelligence quotients and organismic ages had been established, the atudents were given The Nolson Silent Reading Tegt. Mis cest consisted of two parts, vocabulary and paragraph. The voabbulary test consisted of one hundxed words in fiverresponse type. The paragraph test measured three phases of reading ability: ablisty to understand the general significance of the paragraph, ability to denote detail, and ability to predict probable outcome. Scores for both boys and girls on the vocabulary test are shown in Table 2.

## TABLE 2

| 15 | 44 | 28 | 30 | 12 | 12 |

## 11

The highest score possible on the vocabulary test was one hundred. The highest score macho by the girls was forty m two and was reported by student Ho. 3. Four students, Nos. 7, 13, 20, and 26, made cores of elevon. The median score for the girls considered was elfgtean and the mean score we twenty-four.

Scores for the boy g ranged from a low of seven to a high of elity-three reported by pupils Nos. 26 and 7 respectively. The neaten score for the boys was twentyought and the mean score was 19.6.

The modian gore set up by the author of The Nelson Silent Reading Fest is twelve. I The median score for the group considered in the present study was twenty-six. Seventeon boys and fourteen girls had scores equal to or above the median score for the group.

The mean score for the entire group was twenty-five. Thinty-one of the sixty pupils considered made scores above tho average score for the group. piftean girls had scores that exceeded those of their partners. only one past, pair Ho. 13, had scores that were the same.

The greatest variation in the scores for pairs occurred in pupils lo. 7. The boy of the pair had a score of fiftythree out of a possible one hundred while his counterpart had score of only eleven. Mo explanation for this
$I_{\text {Nelson, op. gte, p. }}$.
diacropancy can be givon. Dany of students deaignated as Mos. 13 had the sane acorc and pupla Mos. 30 also had aqut acores.

The fixst part of the paragraph toat moasureo the ability of the students to understand the genoral signtfenco of a paragraph. Scoves fox the thaty parse or students are convained in mable 3.

TABLE 3
SCOMDS FOR BOYS AND MIRLS OE ABILITY TO UMDERSTADD MHE GLEDRAE SLCNLETCACOE OE A PARACRAPU

| Pupil | Scores |  | Pupil | Scores |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Boys | Oixls |  | Boys | Gavls |
| 1 | 6 | 4 | 16 | 6 | 12 |
| 2 | 14 | 18 | 17 | 5 | 10 |
| 3 | 15 | 20 | 18 | 6 | 13 |
| 4 | 10 | 9 | 19 | 9 | 9 |
| 5 | 1 | 13 | 20 | 7 | 2 |
| 6 | 9 | 13 | 21 | 9 | 13 |
| 7 | 14 | 4 | 22 | 11 | 9 |
| 9 | 11. | 9 | 23 | 9 | 8 |
| 9 | 8 | 10 | 24 | 10 | 9 |
| 10 | 14 | 10 | 25 | 35 | 12 |
| 11 | 14 | 13 | 20 | 6 | 1 |
| 12 | 14 | 16 | 27 | 8 | 14 |
| 13 | 6 | 6 | 28 | 9 | 9 |
| 14 | 21 | 11 | 29 | 10 | 1.0 |
| 15 | 14 | 11 | 30 | 11 | 2 |

The highegt possible acore on tinis phase of the test was twonty-five. Scores for the fina ranged man a low of one made by pupil Mo. 20 to a high of twonty reported
by pupil Ho. 3. The modian score for the girls was ten as compared to mean score of oleven for the boys.

For the boys, scores rangec from a low of one to a high of fifteen reported by pupils Mo. 5 and 15 respectively. The median score for the boy was nine as compared with a nean score of oight.

For the entire group, the median score was ten as compared with median score of four set by the author of the test. The mean score for the group was eleven. Ifelve bays and thirtean girls had scores that oxceeded the mean score for the group. The scorea for the girls oxceeded the scores for the boys in twelve casea and only four pains of students had the same seoves. Thus, twenty-five of the thirty pairs of students considered had scores above the sverace.

Pupils No. 13, 14, 19, 28, and 29 had oqual scores. The greatest variation showed up in studenta No. 5. The difference in this case was twolve pointa. Puplla No. 7 , who showed the greatest varlation in scores on the vocabulayy test, had scores that varied by only ten points in favor of the boy on the portion of the test that measured the ability to underatand the meaning of a paragraph. on the wholes the gcores of the paixs were fairly well atstributed and even.

In the over-all view, those who had high scones on the vocabulary test, generally had bigh scores on the
ability to undergtand the general signipleance of paragraph. Howevex. It was not always true that those who had low scores on the vocabulary test had 10 scores on the ability to understand the general significance of a paragraph. These two obaervations woula, howevor, tend to Indicate that vocabulary and ability to comprehend the meaning of connected sentences are closely related.

The second portion of the paragraph tast measured the ablity of boys and girls to denote dotalls. Scores for this portion of the test are shown in Table 4 .

TABLX 4
SCOKES FOR THIRD GRADE BOYS ANL GTRLS ON ABLHTTY TO DEMOTE DETAILS

| Pupil | Scores |  | Pup11 | Scores |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Boys | Girls |  | Boys | Cirls |
| 1 | 7 | 4 | 16 | 7 | 11 |
| 2 | 11 | 14 | 17 | 8 | 10 |
| 3 | 12 | 17 | 18 | 8 | 7 |
| 4 | 8 | 9 | 19 | 7 | 9 |
| 5 | 2 | 7 | 20 | 8 | 3 |
| 6 | 9 | 7 | 21 | 5 | 11 |
| 7 | 17 | 5 | 22 | 9 | 10 |
| 8 | 8 | 11 | 23 | 5 | 10 |
| 9 | 5 | 11 | 24 | 8 | 6 |
| 10 | 10 | 8 | 25 | 9 | 11 |
| 11 | 12 | 11 | 26 | 5 | 1 |
| 12 | 14 | 14 | 27 | 3 | 8 |
| 13 | - | 8 | 28 | 10 | 6 |
| 14 | 8 | 10 | 28 | 9 | 10 |
| 15 | 12 | 21 | 30 | 8 | 2 |

The highest score possible on this phase of the test was twenty-ilve. The boys had a high score of fourteon, as reported by pupil No. 12, an a low score of two nade by student No. 5. The median score for the boys was elght, and the mean score was ten.

For the flris, the low score was one, as reported by pupil Mo. 26, and the high score was seventoen, as reported by pupil No. 3. The modian score for the girls was nine, and the mean score was elght.

The median score for the group was nine, five points above the median score sot up by the anthor of the test adrinistered. The mean scoro for the group was soven. Forty-seven boys and girls had scores that exceeded the mean score for the group. Scores for the girla exceeded scores for the boys in fifteen instances, and only three pairs of students had aqual scores*

Again students No. 7 showed the greatest variation in scores. The afference in their scores was twelve points In favor of the boy. Students No. 12, 13 , and 27 had oqual scores. For the third time, students No. 13 had equal scores. mose who had high scores on vocabulary and ability to understand the goneral significance of a paragraph generally were the students to make high scores on the abllity to denote detalls.

The last portion of the paragraph test measured the ability of students to prodict probable outcome. Scores
on this phase of test are ahown for the boys and girls in the thime grade in fable 5.

TABLE 5
SCONES FOR BOYS AND GLRLS OR AETLITY TO PRELIOT PROWABLE OTTCOME

| 14 | 8 | 12 | 29 | 12 | 10 |
| 15 | 13 | 11 | 30 | 6 | 4 |

Scores on this aection of the whole tost ranged from a high of nineteon for both the boys and the sxla to a Low of two for the boys. for the boys, student vo. 26 roported a low scote of two while atwhent ho. 7 xeported a hich seore of ninetoon. fone median acoro fox the boya was nine as well as was the mean score. This would signify a nomal aiatribution. Gupil lo. 26 reported the 1 score of three, ard pupil wo. 3 reported score of nineteen for the girls. The nedian score for the ginls was ton as compared with a radian ecore of nine for the boys.

For the group the median score was nine, three thas the redian score ast up by the athor of the test for third grade atudenta. The mean score for the group was ten. In thirty Ingtances the scores made by the boys and firla conshered oxcoeded the mean score. In soventeon instrances the scores for the boys exceaded the scores for the girla. In four cases the scores for the boys and gixis wore the same.

The scorea for tho palxs of atwaents constiered were more nearly oqual on this portion of the test than on any of the othor phases, The greatest variation was four as
 students, loa. 4, 7, b, 12, and 29 had equal scores.

Lt is interegting to noto that students Wo. 7 who on ather phases of the test had the reateat variathon in acores, had equal scores on this phase of the test. unildren in the same grado will differ greatiy in their reading

## 18

abilitieg aven though they have recelved a similar amount and type of reading instruction. These differences in devel spment are due to variations in intelligence, in sensory capacitiea, in physical condition, in background of language development, and in confugions and faulty habita In the leaming process.

The nine-to-eleven-year period is one of steady progresa in physical development and rather important changes in mental and social activitias. The influence of the group is all important, but at the same time individual interests are beginning to appear. Boys and girls begin to develop separete interests in reading and varied materials must be availablo.

CHAPIER III

COMPARISON OF SOORES EOR BOYS AND GIFLS

Standardized tests are published tests which may be objectively scored and which fumish norms-atandards of achievement-making it possible to compare a spocific group With a much larger group of gimilar age of grade. Thero are many standardized reading tests. Anong them can be found tests that measure practically all of the comprehonsion abilities, the study skills, general level of word recognition, vocabulary, rate of reading, accuracy and spoed of oral reading, and the ability to read content subjects. Standardized tests derive their merit from the reliability with which they measure Indiviauals within a group. Host standardized tosts have been carerully construeted so that on repeated testing a pupil geta approximatoly the same score. The teata are ralatively accurate measures of the pupil's ability in the attribute boing measured by the teat. They aleo havo merit in that they can give a maximum of information in a minimum of time. They are so desfoned that they may be easily scorod. By and Large, too, they measure important attributesmmoading abilities and akiliathat have been thought to be of sufficient inportance to warrant careful measuremont. The greateat single value in
standardizad tests is, however, that thelr norms make possible comparisons of the attainments of a class or individuals within the class in various important learnings in reading. In other words, the administration of standardized tests make it easy to tell the levels of the various abilities of child, or of a class, in relation to the noxms of the large number of children that took tho test while the test was belne standardized.

As has been previously stated, the vocabulary test consisted of one hundrea words in fiveresponse type. The highest possible score therefore would be one hundred. por third grade students the author of The Nelson Sllent ReadIng Toat found the median score on tho vocabulary test to be twalve.

The highest possible acore on each of the three phases of the paragraph test was twenty-ifive. The highost possible total score for an individual student on all phasea of the teat would be 175. In the previous chapter the seores for both boya and girls were recorded on each gection of the test. The total scores on all phases of the Melson Silent Reading Fest for the thirty pairs of students considered are shown in Table 6.

It is well to recall at this point that the boys and Eixis were pairec on the basis of their organismic ages and that their intelligence quotients did not vaxy more than afghteon polnts. Table 6 shows the comparison of total scones

| 15 | 83 | 61 | 30 | 37 | 20 |

on all phases of The Melson Silent Reading Test for the boys and girls. The greatest discrepancy was in the total score of pupils No. 7. The giri had a total score on The Nelson

Bllent heading Teat of twenty-seven while the boy with whom she was paired had a total score of 108. No lugical explanation can be offered for this difference. The intelligence quotients for the pair were 119 for the girl and 113 for the boy. This difference in intelligence quotients does not beax out the wide difference in total reading ability acore.

The scores of pupils wos. 13, 14, 28, and 29 vavied by only two points. Intelligence quotients for those students verfed only four, eighteen, two, and four pointa respectively.

In eighteen cases the total scores for the boys exceeded the total acores of the girls. The mean acore for the girls was forty-six and the mean score for the boys was iffty-two. Sixteen boys and thirteen girls had total scores in excess of the mean. This means that a total of twenty-nine students had grades above the average for the group.

The boy who had the highest intelligence quotient, pupil Ho. 12, had a total score of seventy-four. The girls who had the highest intelligence quotients, pupila Mos. 6 and 13, had total scores of thirty-one and thixtymine respectively. On the other hand, the girl who had the lowest intelligence quotient in hex group, had a total score of fortymone, eleven and three points, respectively, higher than the two gixis with the highest intelligence quotients. These data would indicate that in the case of the boys, a high intelilgence quotient would predict a high roading
ability score. For the girls, in a majority of cases the same seems to hold true.

Table 6 tends to ahow that a high intelligence quotient will generally preatet a high score in reading ability. It was not shown that the student with the lowest intelligence quotient made the lowest reading ability score. However, Table 6 does show that both boys and girls of equal organismic ages have approximately equal reading abilities.

As has been shown in the preceaing chapter, the mealan score on each phase of The Nelson Sllent Raading Test for the group of third grade atudents considered exceeded the median score set up by the author of the test. It was felt that the mean score of the testa would be a more accurate basis for comparison. Table 7 has been prepared to ghow a comparison of median and mean scores for boys and girls, as well as for the group on all phases of The Nelson Silent Roading Rost.

A fixst glance at mable 7 shows very little difference in the median and mean scores for boys and girls on all phases of the reading ability test. Also, mean and median scores for the boys and for the girls closely parallal those for the entire group.

The mean scor for the ontire group on the vocabulary test was twenty-five. The nean score for the giris on this phase of the test was nearer the mean for the group. The mean score for the boys was 19.6 as compared with a moan

TABLE 7
MEAN AND MLDLAN SOORES HOR BOYS, GIRLS, AND FOR GROUP ON ALE PEASES OR THE MELSON

SILENT READTMG TEST

| Test Phase | Mean |  |  | dedian |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Boys | G1x18 | aroup | Boys | cards | Group |
| Vocabulaxy | 19.6 | 24 | 25 | 28 | 18 | 26 |
| Ability to unaerm stand the general signifLeance of a paragraph | $\varepsilon$ | 10 | 11 | 9 | 10 | 10 |
| Ability to denote details | 10 | 8 | 7 | 8 | 9 | 9 |
| Abllity to prodict probable outcome | 9 | 9 | 9 | 9 | 10 | 9 |
| Total score | 54 | 49 | 51 | 52 | 46 | 53 |

score of twenty-foux for the girls. The median score for the group on the vocabulaxy tost was twontymaix. For the boys, the median score was twenty-elght, and for the gixls, exchteen.

Eleven was the mean score for the group on the portion of the test that measured the ability to understand the general significance of paragraph. The mean score for the girls was two points above the mean acore for the boys and one potnt below the mean score for the group. The median
score on this phase of the test for the group was ton and It was also the menian score for the givis. The median score for the boys was one potnt less.

On the test to determine the ability to denote detaila the group hed mean acore of seven. The mean scores for both the boys and girls exceeded that of the group. The maen score for the boys was three points above that for the group. The boys had a medtan score of eight, juat one point above that for the Efirls and for the group.

The mean score for the group on ability to preatet probable outcome was ten. The mean scores for both the boys and girls were the same as that for the group.

The mean core for the group on the entire test was fifty-one. The man score for the boys, fiftymour, exceeded the man score for the givis by five points. The median score for the boys was juat one point below the median score for the entire group. The median sore for the girls was forty-six.

The highest mean acore for the boys on the paragraph test was on the section measuring the ability to understand the general significance of paragraph and ability to predict probable outcome. There is no valid explanation for the lack of uniformity of scores on this phase of the test for the girls.

To be able to axplain the difiexences in reading ability scores, one would have to be famjliar with the individual
differences of the puplls. mhis implies more than a vague knowledge of home background, personality and motional problems, and reading-achievement lovel.

By referring to the bables in Chapter II of the present study, It is observed that the boys who had the highest Antelligence quotientif also had high scores on the vocabulary test and that the ones who had low intelligence quotiente had 10 w scores on the vocabulary test. This was not true In the case of the girls. The girl with the loweat Intelligence quotient had a low score on the vocabulary best, but one of the girls with the highest intelligence quotient also had a low score on the vocabulary test.

In ability to understand the general significance of a paragraph, the boys who made the high acored were the boys with high intelligence quotionts. The same was generally true for the girls. Intelligence quotients that are high seen to predict a high acore on abllity to understand the general aignificance of a paragraph.

For both the boys and the girls those with high intelligence quotients generally had high scores on the phase of the tast that measured the ability to denote detalls. Also, those with low intelligence scores generally had low scores on this phase of the test.

On ability to prodict probable outcone, the students with high intelligence quotients had high scores, and the students with 2 cw intalligence quotients had 1 w cores.

In most cases, the scores for the boya excesded tho scores for the girla on this phase of the whole test.

## CORCLUSIONS ARD RECODMODATIONS

The present stualy has compared the readng ability scores of boys and girls of equal organismic ages in the thixd grade of the Graham, Toxas, Blementary School to detarmine if there is any difference in the reading ability scores of boys and girls. The organismic ages of the students considered did not vary more than 2 of point and the intelligence quotients for these pupils did not vary more than eighteen points. The students were given The Nelson Silent Reading Tost which measured four phases of reading ability. The four phases measured were vocabulary, ability to underatand the general significance of a paragraph, ability to denote detail, and ability to predict probable outcome.

Conclusions
From the results of the tests given the boys and girls In the third grade of the Graham, Texas, Elementary School, and the data presented in the preceding chapters, the following conclusions have been reached:

1. The girls had slightly higher scores on tho vocabulary test than the boys.
2. The boys and girls did equally well on the test to measure ability to understand the general significance of a paragraph.
3. Scores for the girls were higher on the abllity to denote detall than were those for the boys.
4. The boys had higher scores on ability to predict probable outcome than the girls.
5. The boys had higher total scores than the girla In seventeen instances as shown in Table 6.
6. Boys and girla of equal intelligence ald not differ greatiy in reading ability.
7. Silent reading oniy was considered; the results do not necessarily apply to oral reading achievement. There are many factore involved in reading which wexe not investigatod.
8. Probably, under properly controlled conditione, there is no significant difforence in the average reading ability of the two sexes.

## Recomendations

On the basla of data gleaned from related studies, results of the teste administered, pexsonal observation of third grade reading students, and disousaion with other teachers of reading certain recommendations for future reference are in order:

1. There is more need for "longitudinal" research; that is, research that covers longer periods of time in
checking the relationship between reading ability and phyalological, intellectual, enotional, social, and experiential maturity, respectively.
 areas discussod in this stway should be used in further research in regard to the effects of reading content on children.
2. Fesearch to find more effective ways of teaching children to read critically should be made.
3. The results of such research should be applied to teaching in the lower grades.
4. A further study might show a comparison of home background and personality adjustment between children who atate that they read most of their spare time, and children who atate that they seldom if ever read for pleasure.
