MASTER

INSTRUCTIONS FOR COMPLETION OF THE ENGINEERING DATA TRANSMITTAL

(USE BLACK INK OR TYPE)

BLOCK	TITLE	
(1)*	EDT	<ul style="list-style-type: none"> ● Pre-assigned EDT number.
(2)	To: (Receiving Organization)	<ul style="list-style-type: none"> ● Enter the individual's name, title of the organization, or entity (e.g., Distribution) that the EDT is being transmitted to.
(3)	From: (Originating Organization)	<ul style="list-style-type: none"> ● Enter the title of the organization originating and transmitting the EDT.
(4)	Related EDT No.	<ul style="list-style-type: none"> ● Enter EDT numbers which relate to the data being transmitted.
(5)*	Proj./Prog./Dept./Div.	<ul style="list-style-type: none"> ● Enter the Project/Program/Department/Division title or Project/Program acronym or Project Number, Work Order Number or Organization Code.
(6)*	Cognizant Engineer	<ul style="list-style-type: none"> ● Enter the name of the individual identified as being responsible for coordinating disposition of the EDT.
(7)	Purchase Order No.	<ul style="list-style-type: none"> ● Enter related Purchase Order (P.O.) Number, if available.
(8)*	Originator Remarks	<ul style="list-style-type: none"> ● Enter special or additional comments concerning transmittal, or "Key" retrieval words may be entered.
(9)	Equipment/Component No.	<ul style="list-style-type: none"> ● Enter equipment/component number of affected item, if appropriate.
(10)	System/Bldg./Facility	<ul style="list-style-type: none"> ● Enter appropriate system, building or facility number, if appropriate.
(11)	Receiver Remarks	<ul style="list-style-type: none"> ● Enter special or additional comments concerning transmittal.
(12)	Major Asm. Dwg. No.	<ul style="list-style-type: none"> ● Enter applicable drawing number of major assembly, if appropriate.
(13)	Permit/Permit Application No.	<ul style="list-style-type: none"> ● Enter applicable permit or permit application number, if appropriate.
(14)	Required Response Date	<ul style="list-style-type: none"> ● Enter the date a response is required from individuals identified in Block 17 (Signature/Distribution).
(15)*	Data Transmitted	
	(A)* Item Number	<ul style="list-style-type: none"> ● Enter sequential number, beginning with 1, of the information listed on EDT.
	(B)* Document/Drawing No.	<ul style="list-style-type: none"> ● Enter the unique identification number assigned to the document or drawing being transmitted.
	(C)* Sheet No.	<ul style="list-style-type: none"> ● Enter the sheet number of the information being transmitted. If no sheet number, leave blank.
	(D)* Rev. No.	<ul style="list-style-type: none"> ● Enter the revision number of the information being transmitted. If no revision number, leave blank.
	(E) Title or Description of Data Transmitted	<ul style="list-style-type: none"> ● Enter the title of the document or drawing or a brief description of the subject if no title is identified.
	(F)* Impact Level	<ul style="list-style-type: none"> ● Enter the appropriate Impact Level (Block 15). Also, indicate the appropriate approvals for each item listed, i.e., SQ, ESQ, etc. Use NA for non-engineering documents.
	(G) Reason for Transmittal	<ul style="list-style-type: none"> ● Enter the appropriate code to identify the purpose of the data transmittal (see Block 16).
	(H) Originator Disposition	<ul style="list-style-type: none"> ● Enter the appropriate disposition code (see Block 16).
	(I) Receiver Disposition	<ul style="list-style-type: none"> ● Enter the appropriate disposition code (see Block 16).
(16)	Key	<ul style="list-style-type: none"> ● Number codes used in completion of Blocks 15 (G), (H), and (I), and 17 (G), (H) (Signature/Distribution).
(17)	Signature/Distribution	
	(G) Reason	<ul style="list-style-type: none"> ● Enter the code of the reason for transmittal (Block 16).
	(H) Disposition	<ul style="list-style-type: none"> ● Enter the code for the disposition (Block 16).
	(J) Name	<ul style="list-style-type: none"> ● Enter the signature of the individual completing the Disposition 17 (H) and the Transmittal.
	(K)* Signature	<ul style="list-style-type: none"> ● Obtain appropriate signature(s).
	(L)* Date	<ul style="list-style-type: none"> ● Enter date signature is obtained.
	(M)* MSIN	<ul style="list-style-type: none"> ● Enter MSIN. Note: If Distribution Sheet is used, show entire distribution (including that indicated on Page 1 of the EDT) on the Distribution Sheet.
(18)	Signature of EDT Originator	<ul style="list-style-type: none"> ● Enter the signature and date of the individual originating the EDT (entered prior to transmittal to Receiving Organization). If the EDT originator is the cognizant engineer, sign both Blocks 17 and 18.
(19)	Authorized Representative for Receiving Organization	<ul style="list-style-type: none"> ● Enter the signature and date of the individual identified by the Receiving Organization as authorized to approve disposition of the EDT and acceptance of the data transmitted, as applicable.
(20)*	Cognizant Manager	<ul style="list-style-type: none"> ● Enter the signature and date of the cognizant manager. (This signature is authorization for release.)
(21)*	DOE Approval	<ul style="list-style-type: none"> ● Enter DOE approval (if required) by letter number and indicate DOE action.

*Asterisk denote the required minimum items check by Configuration Documentation prior to release; these are the minimum release requirements.

B08Y33	B08Y58	B08Y83	B08YB8	B08YF3
B08Y34	B08Y59	B08Y84	B08YB9	B08YF4
B08Y35	B08Y60	B08Y85	B08YC0	B08YF5

Westinghouse-Hanford has requested that a minimum of 20% of the total number of Sample Delivery Groups be validated for the 100-FR-3 Operable Unit Third Round Groundwater Sampling Investigation. Therefore, the data from the chemical analysis of 51 samples from this sampling event and their related quality assurance samples were reviewed and validated to verify that reported sample results were of sufficient quality to support decisions regarding remedial actions performed at this site. The samples were analyzed by Thermo-Analytic Laboratories (TMA) and Roy F. Weston Laboratories (WESTON) using U.S. Environmental Protection Agency (EPA) CLP protocols.

Sample analyses included:

- Volatile organics
- Semivolatile organics
- Pesticide/PCB organics

WHC-SD-EN-TI-211, Rev. 0

- Inorganics
- General chemical parameters.

The table below lists the Sample Delivery Groups (SDGs) that were validated for this sampling event. The validated data and the non-validated results for the remaining samples are included in this report.

SDG No.	Matrix	No. of Samples Analysed	Parameters
B08Y15	W	25	Wet Chem
B08Y26	W	8	VOC
B08Y41	W	10	VOC
B08Y41	W	7	BNA, Pest/PCBs
B08Y41	W	5	Inorganics, Wet Chem
B08Y42	W	5	Inorganics
B08Y76	W	4	VOC
B08Y76	W	2	Inorganics, Wet Chem
B08Y77	W	2	Inorganics
B08Y91	W	8	VOC
B08Y91	W	4	BNA, Pest/PCBs, Inorganics, Wet Chem
B08Y92	W	4	Inorganics
B08Y94	W	4	Wet Chem
B08YB1	W	2	VOC, Inorganics
B08YB1	W	1	BNA, Pest/PCBs, Wet Chem
B08YB5	W	2	VOC, Inorganics
B08YB5	W	1	BNA, Pest/PCBs, Wet Chem

Twenty-five samples were validated for radiochemical parameters by TMA and Teledyne. Analytical protocols specified in the Westinghouse Hanford Company Statement of Work for Nonradioactive Inorganic/Organic and Radiochemical Analytical Services were used. Sample analyses included the following:

- Gross alpha and gross beta determination
- Alpha spectroscopy
- Gamma spectroscopy
- Strontium-90

- Technetium-99
- Carbon-14
- Tritium.

SDG No.	Matrix	No. of Samples Analyzed	Parameters
B08Y11	W	9	Radiochemistry
B08Y26	W	14	Radiochemistry
B08YB1	W	1	Radiochemistry
B08YB5	W	1	Radiochemistry

The radiochemical data summary tables can be found following Section 13.8.

Data quality was reviewed and analytical results validated using Westinghouse-Hanford procedures and related EPA CLP protocols and guidelines. Data were qualified based upon their quality and the guidance provided by these sources. In instances where the two protocols differed, the Westinghouse-Hanford guidance was followed.

Two sets of split samples were submitted to TMA and Roy F. Weston Laboratories as shown below:

Set 1:

<u>Sample No.</u>	<u>Split Sample No.</u>	<u>Well Location</u>
B08Y76	B08YB1	199-F7-1
B08Y77	B08YB2	199-F7-1
B08Y78	B08YB3	199-F7-1
B08Y79	B08YB4	199-F7-1

Set 2:

<u>Sample No.</u>	<u>Split Sample No.</u>	<u>Well Location</u>
B08Y91	B08YB5	199-F8-2
B08Y92	B08YB6	199-F8-2
B08Y93	B08YB7	199-F8-2
B08Y94	B08YB8	199-F8-2

The sample and split samples for both well locations were included in the validated data. The results were compared using the sample guidelines for determining the RPD between a sample and its duplicate. All results for both well locations appear in the summary tables within this report.

Two sets of field duplicate samples were submitted to TMA as shown below.

Set 1:

<u>Sample No.</u>	<u>Duplicate Sample No.</u>	<u>Well Location</u>
B08Y76	B08YC0	199-F7-1
B08Y77	B08YC1	199-F7-1
B08Y78	B08YC2	199-F7-1
B08Y79	B08YC3	199-F7-1
B08Y80	B08YC3	199-F7-1

Set 2:

<u>Sample No.</u>	<u>Duplicate Sample No.</u>	<u>Well Location</u>
B08Y91	B08YC5	199-F8-2
B08Y92	B08YC6	199-F8-2
B08Y93	B08YC7	199-F8-2
B08Y94	B08YC8	199-F8-2
B08Y95	B08YC9	199-F8-2

The duplicate sample results for both well locations were included in the validated data. The results were compared using the sample guidelines for determining the RPD between a sample and its duplicate. All results fell within the required control limit. All results for both well locations appear in the summary tables within this report.

Two sets of equipment blanks were submitted to TMA, Weston and DataChem as shown in the table below. Both sets were collected on 7/23/93 and designated EB-1 and EB-2, respectively.

Set 1:

Set 2:

<u>Sample Number</u>	<u>Sample Number</u>
B08YD0	B08YD5
B08YD1	B08YD6
B08YD2	B08YD7
B08YD3	B08YD8
B08YD4	B08YD9

Under EPA protocol, equipment blanks are water samples used to indicate whether or not decontamination procedures were adequate or that contamination was not inherent in the equipment used. The equipment blank information provided was inadequate to determine what contamination, if any, was a result of the equipment used. Equipment blanks require well number locations and associated sample numbers in order to make such a determination.

The report is broken down into sections for each chemical analysis and radiochemical analysis type. Each section addresses the data package completeness, holding time adherence, instrument calibration and tuning acceptability, blank results, accuracy, precision, system performance, as well as the compound identification and quantitation. In addition, each section has an overall assessment and summary for the data packages reviewed for the particular chemical/radiochemical analyses. Detailed backup information is provided to the reader by SDG No. and sample number. For each data package, a matrix of chemical analyses per sample number is presented, as well as data qualification summaries.

Laboratory and data validation personnel added qualifiers to the reported data based on specified data quality objectives. The data reporting qualifiers are summarized as follows:

- U - Indicates the analyte was analyzed for and not detected. The value reported is the sample quantitation limit corrected for dilutions and moisture content. It should be noted that the sample quantitation limit may be higher or lower than the contract or method required detection limit, depending on instrumentation, matrix and concentration factors.
- J - Indicates the analyte was analyzed for and detected. However, the associated value is considered to be an estimate due to identified QC deficiencies. Data flagged with a "J" may be usable for decision making purposes, depending upon the DQOs of the project. Laboratories qualify all reported organic detects below CRQL with a "J" per the CLP procedures.
- UJ - Indicates the analyte was analyzed for and not detected. However, the associated detection limit is considered to be an estimate due to identified QC deficiencies. Detection limits flagged with a "UJ" may be usable for decision making purposes, depending upon the DQOs of the project.
- JN - Indicates the analyte was analyzed for and that there is presumptive evidence of the presence of the compound. The concentration reported is considered an estimate which should be used for informational purposes only.
- R - Indicates the analyte was analyzed for and due to a significant QC deficiency, the data are deemed unusable. Analytic results flagged "R" are invalid and provide no information as to whether or not the analyte is present.

It should be noted that, frequently, results will bear two qualifiers - one given by the laboratory and one given during the validation process. For example, a "U" qualifier is given by the

laboratory when the compound has not been detected during the analysis, and a "J" qualifier may be added during the validation to qualify the result due to minor quality problems. Therefore, the resulting qualification is "UJ", where the "U" qualifier has been given by the laboratory and the "J" qualifier given by the validator.

The results of data validation performed for the 100-FR-3 Operable Unit Third Round Groundwater Sampling Investigation are contained in the tables following each of the chapters in this report.

Several general quality trends which resulted in data qualification were observed. These included:

- Minor laboratory blank contamination was noted in the volatile and semivolatile results for some samples. The contaminants were compounds commonly found in analytical laboratories and the corresponding sample results were flagged accordingly.
- The continuing calibration result for one compound grossly exceeded QC limits for one pesticide/PCB sample. All associated sample results were rejected and flagged "R".
- The surrogate recovery results for one pesticide/PCB samples did not meet QC limits. All associated sample results were flagged "J".
- The initial calibration result for one pesticide/PCB compound did not meet QC limits for one sample. The associated sample result was flagged "J".
- The metals analysis showed minor matrix spike accuracy problems and analytical spike recoveries below the QC limit. Approximately 15 percent of the metals results were flagged "J" due to these factors.
- Both positive and negative laboratory blank contamination was noted in the inorganics analysis. Associated results were flagged accordingly. Contamination, however, was not sufficiently high to affect the usability of the data.
- The holding time from sample collection to preparation and analysis was exceeded for pH, phosphate and hydrazine in several wet chemistry data packages. In one data package results were grossly exceeded. Associated results were flagged accordingly.
- Insufficient calibrations were performed by the laboratory for several wet chemistry analyses in numerous data packages. All associated results were flagged accordingly.

- Due to low chemical yields, the isotopic plutonium, americium-241 and technetium-99 results in several samples were rejected and flagged "R".
- All alpha spectroscopy results in two SDGs were qualified as estimates due to peak resolution results outside of QC limits.
- Insufficient calibrations were performed by the laboratory for several radiochemistry analyses in numerous data packages. All associated data were flagged accordingly.

In general, the protocol-specific QA/QC requirements were met for the samples analyzed in this investigation with the exceptions noted above and discussed in detail in the chapters to follow. All requested analyses were performed.

With the exceptions noted above, the protocol-specific data quality objectives in terms of precision, accuracy, completeness, representativeness, and comparability have been met.

2.0 VOLATILE ORGANIC DATA VALIDATION

2.1 DATA PACKAGE COMPLETENESS

The following data packages (SDG Nos.) were submitted for validation and found to be complete:

B08Y26	B08Y76	B08Y96	B08YB5
B08Y41	B08Y91	B08YB1	

2.2 HOLDING TIMES

Analytical holding times were assessed to ascertain whether the Westinghouse-Hanford holding time requirements for volatile organic analyses were met by the laboratory. The Westinghouse-Hanford holding time requirements for volatile organic analyses are as follows: soil samples must be analyzed within 14 days of the date of sample collection; aqueous samples must be analyzed within seven days of the date of sample collection (if unpreserved); and all samples must be shipped on ice to the laboratory and stored at 4°C until analysis.

Holding times were met for all samples.

2.3 INSTRUMENT CALIBRATION AND TUNING

Instrument calibration is performed to establish that the GC/MS instrument is capable of producing acceptable and reliable analytical data over a range of concentrations. The initial and continuing calibrations are to be performed according to CLP protocols. An initial multipoint calibration is performed prior to sample analysis to establish the linear range of the GC/MS instrument. Continuing calibration checks are performed to verify that instrument performance is stable and reproducible on a day-to-day basis.

All initial and continuing calibration results were acceptable.

2.3.1 GC/MS Tuning/Instrument Performance Check

Tuning is performed to ensure that mass resolution, identification, and, to some degree, sensitivity of the GC/MS instrument have been established. When analyzing for volatile organics, instrument tuning is performed with BFB. Instrument tuning must be performed prior to the analysis of either

standards or samples and must meet the criteria for acceptable GC/MS instrument tuning using BFB as outlined in Westinghouse-Hanford (WHC 1992) and in EPA (EPA 1988b and 1991) criteria.

The original data were checked for transcription and calculation errors to verify that tuning criteria were met. Prior to calibration and sample analysis, all tuning criteria were met.

All GC/MS tuning data were acceptable.

2.4 BLANKS

Method blank, field blank and trip blank analyses are performed to determine the extent of laboratory or field contamination of samples. No contaminants should be present in the blanks. Analytical results for analytes present in any sample at less than 5 times the concentration of that analyte found in associated blanks should be qualified as non-detects; common laboratory contaminants present in samples at less than 10 times the concentration of that analyte in the associated blank are qualified as non-detects.

Due to the presence of laboratory blank contamination, the following samples were flagged "U" for methylene chloride:

- Sample numbers B08YB1 and B08YB3 in SDG No. B08YB1.
- Sample number B08YB5 in SDG No. B08YB5.

Due to the presence of laboratory blank contamination, the following sample was flagged "U" for acetone:

- Sample number B08YB7 in SDG No. B08YB5.

All other laboratory blank results were acceptable.

2.5 ACCURACY

Accuracy was assessed by evaluating the recoveries of stable isotopically labeled surrogate compounds added to all samples and blanks, and by the analysis of a representative sample which was spiked with a variety of volatile organic compounds.

2.5.1 Matrix Spike Recovery

Matrix spike compounds are added to a sample which is representative of the sample delivery group. Matrix spike analyses are performed in duplicate using five compounds and should be within the established quality control limits (EPA 1988b). The matrix spike analyses estimate how much the target

compounds are interfered with, either positively or negatively, by the sample matrix.

All matrix spike/matrix spike duplicate recovery results were acceptable.

2.5.2 Surrogate Recovery

Matrix-specific surrogate compound recovery control windows have been established by the EPA CLP program. When a surrogate compound recovery is out of the control window, all positively identified target compounds associated with the unacceptable surrogate recoveries are qualified as estimates and flagged "J". Undetected compounds are qualified as having an estimated detection limit and flagged "UJ".

All surrogate recovery results were acceptable.

2.6 PRECISION

Precision is expressed by the RPD between the recoveries of duplicate matrix spike analyses performed on a sample. When the laboratory has not performed duplicate spike analyses, precision may also be assessed using unspiked duplicate sample analyses. Field precision is measured by analyzing duplicate samples taken in the field.

All matrix spike/matrix spike duplicate RPD results were acceptable.

2.7 INTERNAL STANDARDS PERFORMANCE

Internal standard performance was assessed to determine whether abrupt changes in instrument response and sensitivity occurred that may have affected the reliability of the analytical data. The response (area or height) of the internal standards must not vary by more than 100 percent or -50 percent from the response of the internal standard that was used to calculate the upper and lower bounds. The upper and lower bounds define the range for acceptable internal standard response (area/height) for the sample analyses.

All internal standard recovery results were acceptable.

2.8 COMPOUND IDENTIFICATION AND QUANTITATION

The identity of detected compounds are confirmed to investigate the possibility of false positives. The confirmation of compound identification during the quality assurance review focuses on false positives because only mass spectra for positive identifications are submitted. However, target compounds that

are reported as undetected are also evaluated to investigate the possibility of false negatives. Confirmation of possible false negatives is addressed by reviewing other factors relating to analytical sensitivity (e.g., relative response factors, detection limits, linearity, analytical recovery).

Compound quantitations and reported detection limits were recalculated for a minimum of 20 percent of the samples in each case to verify that they are accurate and are consistent with CLP requirements.

Below the CRQL, instrument precision becomes more variable as the instrument detection limit is approached. Therefore, the concentration of any compound that was detected below the CRQL was qualified as an estimate and flagged "J".

All reported results and quantitation limits were verified as correct.

2.9 OVERALL ASSESSMENT AND SUMMARY

A thorough review of ongoing data acquisition and instrument performance criteria was made to assess overall GC/MS instrument performance. No changes in instrument performance were noted that would result in the degradation of data quality. No indications of unacceptable instrument performance (i.e., shifts in baseline stability, retention time shifts, extraneous peaks, or sensitivity) were found during the quality assurance review.

In general, the volatile data presented in this report met the protocol-specified QA/QC requirements. Minor blank contamination was detected in four samples, all from laboratory blank contamination. All other validated data are considered valid and usable within the standard error associated with the method.

3.0 SEMIVOLATILE DATA VALIDATION

3.1 DATA PACKAGE COMPLETENESS

The following data packages (SDG Nos.) were submitted for validation and found to be complete:

B08Y41 B08Y76 B08Y91 B08YB1 B08YB5

3.2 HOLDING TIMES

Analytical holding times were assessed to ascertain whether the holding time requirements for semivolatile analyses were met by the laboratory. Westinghouse-Hanford protocols require that samples be extracted within seven days of collection and be analyzed within 40 days of extraction (WHC 1992a).

Holding time requirements were met for all samples.

3.3 INSTRUMENT CALIBRATION AND TUNING

3.3.1 GC/MS Tuning/Instrument Performance Check

Tuning is performed to ensure that mass resolution, and to some degree, sensitivity, of the GC/MS instrument has been established. When analyzing for semivolatile organic compounds, the GC/MS is tuned using DFTPP. The GC/MS must be tuned prior to the analysis of either standards or samples, and tuning must meet the criteria established by the analytical protocol. The specific criteria for acceptable GC/MS tuning using DFTPP are outlined in Westinghouse-Hanford procedures (WHC 1992a) and in CLP protocols (EPA 1988b and 1991).

As part of data validation, the original tuning data were checked for transcription and calculation errors to verify that tuning and performance criteria were met.

All tuning and performance criteria were met.

3.3.2 Initial Calibration

The GC/MS instrument is calibrated to ensure that it is capable of producing acceptable and reliable analytical data over a range of concentrations. The initial and continuing calibrations are to be performed according to CLP protocols. An

initial multipoint calibration is performed prior to sample analysis to establish the linearity range of the GC/MS instrument. Continuing calibration checks are performed to verify that instrument performance is stable and reproducible on a day-to-day basis.

Instrument response is established by the initial calibration when the RRFs for all target compounds are greater than or equal to 0.05 units. Linearity is established when the RSDs of the RRFs are less than or equal to 30 percent.

All initial calibration results were acceptable.

3.3.3 Continuing Calibration

The criteria for accepting the continuing calibration require that a standard be analyzed at least once per 12 hour period and that the RRFs of all target compounds be greater than or equal to 0.05 units. In addition, the percent difference of these RRFs must be less than or equal to 25 percent of the average RRFs calculated for the associated initial calibration.

All continuing calibration results were acceptable.

3.4 BLANKS

Method blank and field blank analyses are performed to determine the extent of laboratory or field contamination of samples. No contaminants should be present in the blanks. Analytical results for analytes present in any sample at less than 5 times the concentration of that analyte found in associated blanks should be qualified as non-detects; in the case of certain common laboratory contaminants, results less than 10 times the concentrations of that analyte in the associated blanks are qualified as non-detects.

Due to the presence of laboratory blank contamination, the following samples were flagged "U" for bis(2-ethylhexyl) phthalate:

- Sample number B08Y56 in SDG No. B08Y41.
- Sample number B08YB5 in SDG No. B08YB5.

Due to the presence of laboratory blank contamination, the following sample was flagged "U" for di-n-butylphthalate:

- Sample number B08YB5 in SDG No. B08YB5.

All other blank results were acceptable.

3.5 ACCURACY

Accuracy was assessed by evaluating the recoveries of stable isotopically labeled surrogate compounds added to all samples and blanks, and by the analysis of a representative sample which was spiked with a variety of organic compounds.

3.5.1 Matrix Spike Recovery

Matrix spike compounds are added to a sample which is representative of the sample delivery group. Matrix spike analyses are performed in duplicate using the six compounds specified by CLP protocols. All recoveries for the compounds should be within the established QC limits (EPA 1988b). The matrix spike analyses estimate how much the analyses for the target compounds are interfered with, either positively or negatively, by the sample matrix. Because the matrix spike is performed using only one of the samples extracted within the SDG, these data alone cannot be used to evaluate the precision and accuracy of individual samples.

All matrix spike/matrix spike duplicate recovery results were acceptable.

3.5.2 Surrogate Recovery

Surrogate compound recoveries are calculated using analytical results from six stable, isotopically labeled surrogate compounds added to the sample prior to sample preparation and analysis. Matrix-specific surrogate compound recovery control windows have been established by the EPA CLP program. When recoveries for any two surrogate compounds are out of the control window, all positively identified target compound concentrations in samples associated with the unacceptable surrogate recoveries are qualified as estimates and flagged "J" and undetected compounds are qualified estimated below the detection limit and flagged "UJ".

Surrogate recovery results were acceptable for all samples.

3.6 PRECISION

The precision is expressed by the RPD between the recoveries of the matrix spike and the matrix spike duplicate analyses performed on a sample, and through a comparison of the results for field duplicate samples. Acceptable RPD control windows for matrix spike/matrix spike duplicate analyses have been established by the EPA CLP program.

Field precision is measured by analyzing duplicate samples taken in the field. No standards have been established for qualifying data based on RPD for duplicate field samples by CLP

protocols. Westinghouse-Hanford procedures establish the following criteria for duplicate field sample analyses for organic compounds, based on criteria established for inorganic analyses for laboratory duplicates:

1. For compounds whose concentrations are greater than 5 times CRQL, RPDs, must be ± 20 percent for aqueous samples and ± 35 percent for soil samples.
2. When one or more compounds are present at concentrations less than 5 times CRQL, the concentration difference must be $\pm$ CRQL for aqueous samples and $\pm 2 \times \text{CRQL}$ for soil samples.

All matrix spike/matrix spike duplicate RPD results were acceptable for all samples.

3.7 INTERNAL STANDARDS PERFORMANCE

Internal standard performance was assessed to determine whether abrupt changes in instrument response and sensitivity occurred that may have affected the reliability of the analytical data. The response (area or height) of the internal standards must not vary by more than -50 percent or +100 percent from the response of the calibration standard that was used to calculate the upper and lower bounds. The upper and lower bounds define the range for acceptable internal standard response (area/height) for the sample analyses. In addition, retention times for the internal standard must not vary more than ± 30 seconds from that of the associated calibration standard.

All internal standard results were acceptable.

3.8 COMPOUND IDENTIFICATION AND QUANTITATION

The identities of detected compounds were confirmed to investigate the possibility of false positives. The confirmation of compound identification during the QA review focuses on false positives because only mass spectra for positive identifications are submitted. However, target compounds that are reported as undetected are also evaluated to investigate the possibility of false negatives. Confirmation of possible false negatives is addressed by reviewing other factors relating to analytical sensitivity (e.g., detection limits, linearity, analytical recovery). Compound retention times and mass spectra must match those for the standard within set to tolerance limits (EPA 1988b).

3.8.1 Reported Results and Quantitation Limits

Compound quantitations and reported detection limits were recalculated and verified to ensure that they are accurate and

WHC-SD-EN-TI-211, Rev. 0

are consistent with the internal standards and relative retention times specified by the CLP scope of work.

At concentrations below the CRQL, instrument precision becomes more variable as the IDL is approached. Therefore, the concentrations of any compound detected below the CRQL are qualified as estimates.

All compound identifications and quantitations have been verified as correct in the validated data.

3.8.2 Tentatively Identified Compounds

Chromatographic peaks may be present in an analysis that are not TCL analytes, surrogates, or internal standards and are considered TIC.

The validator verified that spectral library searches were conducted for at least 20 or less candidate TIC. All compounds, including common laboratory contaminants present in the blanks using Westinghouse-Hanford blank review criteria, were qualified as non-detects and flagged "U".

3.9 OVERALL ASSESSMENT AND SUMMARY

A thorough review of ongoing data acquisition and instrument performance criteria was made to assess overall GC/MS instrument performance. No changes in instrument performance were noted that would result in the degradation of data quality. No indications of unacceptable instrument performance (i.e., shifts in baseline stability, retention time shifts, extraneous peaks, sensitivity) were found during the quality assurance review.

In general, the semivolatile data presented in this report met the protocol-specified QA/QC requirements. Minor laboratory blank contamination was detected in two samples. All other validated data are considered valid and usable within the standard error associated with the method.

4.0 PESTICIDE AND PCB DATA VALIDATION

4.1 DATA PACKAGE COMPLETENESS

The following data packages (SDG Nos.) were submitted for validation:

B08Y41 B08Y76 B08Y91 B08YB1 B08YB5

All packages were found to be complete with the exception of B08YB1. The laboratory failed to a complete Pesticide Evaluation Standards Summary, Form VIII. Subsequently, the reviewer could not evaluate the %RSD values for aldrin and DBC to be certain that they were less than the 10% upper limit. Therefore, as per Westinghouse-Hanford, no action was taken on the basis of a %RSD summary.

4.2 HOLDING TIMES

Analytical holding times were assessed to ascertain whether the holding time requirements for pesticide/F analyses were met by the laboratory. Westinghouse-Hanford procedures require that samples be extracted within seven days of collection and analyzed within 40 days of extraction (WHC 1992a).

Holding time requirements were met for all samples.

4.3 INSTRUMENT PERFORMANCE AND CALIBRATIONS

Instrument performance was assessed to ensure that adequate chromatographic resolution and instrument sensitivity were achieved by the gas chromatographic system.

The specific criteria for acceptable instrument performance are outlined in EPA guidelines (EPA 1988b and 1991), including the evaluation and qualification procedures that may be performed on the analytical results.

Instrument calibration is performed to ensure that the chromatographic system is capable of producing acceptable and reliable analytical data. The initial and continuing calibrations are to be performed according to procedures established by CLP protocols. An initial calibration is performed prior to sample analysis to establish the linear range of the system, including a demonstration that all target compounds can be detected. Continuing calibration checks are

performed to verify that instrument performance is stable and reproducible on a day-to-day basis.

During the quality assurance review, all indicators for acceptable instrument performance were verified. The criteria established by CLP protocols were met and the results are acceptable.

4.3.1 Initial Calibrations

The laboratory performed an initial multipoint calibration for all target compounds at the concentrations required by CLP protocols. The linearity of the initial calibration is established when the percent RSD or the calibration factors are less than or equal to 10 percent (or 15% for certain analytes).

Due to initial calibration results outside of QC limits, the following sample was qualified as an estimate and flagged "J" for endrin aldehyde:

- Sample number B08Y51 in SDG No. B08Y41.

All other initial calibration results were acceptable.

4.3.2 Calibration Verification

The criteria for acceptable continuing calibrations requires that the calibration factors for all target compounds have a percent difference of less than or equal to 15 percent of the average calibration factor calculated for the associated initial calibration standard. The 15 percent difference value is required for results calculated using the chromatographic column which is used for quantitative purposes. In addition, the percent difference of the calibration factors calculated for the chromatographic column that is used for confirmation must be less than or equal to 20 percent.

Continuing calibration results grossly exceeded QC limits for chlordane compounds. Alpha-chlordane and gamma-chlordane were rejected and flagged "R" for sample number B08YB1 in SDG No. B08YB1.

All other calibration verification results were acceptable.

4.4 BLANKS

Method blank and field blank analyses are performed to determine the extent of laboratory or field contamination of samples. No contaminants should be present in the blanks. Analytical results for analytes present in any sample at less than 5 times the concentration of that analyte found in the associated blanks should be qualified as non-detects.

There were no compounds of concern detected in the method or field blanks.

4.5 ACCURACY

Accuracy was assessed by evaluating the recoveries of the surrogate compounds and the matrix spike recoveries calculated for the sample analyses.

4.5.1 Matrix Spike Recovery

Matrix spike analyses are performed in duplicate using six compounds specified by CLP protocols. The recoveries for the six compounds must be within the acceptable quality control limits established by CLP protocols.

All matrix spike/matrix spike duplicate results were acceptable.

4.5.2 Surrogate Recovery

Surrogate compound recoveries are calculated using analytical results from two stable surrogate compounds added to the sample prior to sample preparation and analysis. Matrix-specific surrogate compound recovery control windows have been established by the EPA CLP program. When recoveries for either surrogate compound are out of the control window, all positively identified target compound concentrations in samples associated with the unacceptable surrogate recoveries are qualified as estimates and flagged "J" and undetected compounds are qualified estimated below the detection limit and flagged "UJ".

Sample number B08YB5 in SDG No. B08YB5 exhibited low surrogate recoveries on one column for surrogate compound tetrachloro-m-xylene. All associated results were qualified as estimates and flagged "J".

Surrogate recovery results were acceptable for all other samples.

4.6 PRECISION

Precision is expressed by the RPD between the recoveries of the matrix spike and the matrix spike duplicate analyses performed on a sample. When the laboratory has not performed duplicate spike analyses, precision may also be assessed by using unspiked duplicate analyses.

All matrix spike/matrix spike duplicate RPDs were acceptable.

4.7 COMPOUND IDENTIFICATION AND QUANTITATION

The data were evaluated to confirm the positive concentrations and to investigate the possibility of false negatives in all other data. Confirmation of possible false negatives is addressed by reviewing other factors relating to analytical sensitivity (e.g., detection limits, instrument linearity, analytical recovery). These factors were found to be in control, and the data are acceptable.

Compound quantitations and reported detection limits were recalculated and verified for a minimum of 20 percent of the samples in each case to ensure that they were accurate and are consistent with CLP requirements (EPA 1991). The reported detection limits must be in accordance with the CRQLs specified in the applicable CLP statement of work.

All validated compound identifications, CRQLs, and quantitation results were acceptable.

4.8 OVERALL ASSESSMENT AND SUMMARY

A thorough review of ongoing data acquisition and instrument performance criteria was made to assess overall GC/MS instrument performance. No changes in instrument performance were noted that would result in the degradation of data quality. No indications of unacceptable instrument performance (i.e., shifts in baseline stability, retention time shifts, extraneous peaks, or sensitivity) were found during the quality assurance review.

In general, the pesticide/PCB data presented in this report met the protocol-specified QA/QC requirements. All chlordane results in one sample were rejected due to extremely low continuing calibration results. Rejected data are unusable for all purposes. The initial calibration result for one sample did not meet QC limits for endrin aldehyde. The associated sample result was qualified as an estimate and flagged "J". Due to low surrogate recovery results, all compounds associated with one sample were qualified as estimates and flagged "J". Estimated data are usable for limited purposes only. All other validated data are considered valid and usable within the standard associated with the method.

5.0 INORGANIC DATA VALIDATION

5.1 DATA PACKAGE COMPLETENESS

The following data packages (SDG Nos.) were submitted for validation and checked for completeness:

B08Y41	B08Y76	B08Y91	B08YB1
B08Y42	B08Y77	B08Y92	B08YB5

5.2 HOLDING TIMES

Analytical holding times for ICP metals, GFAA metals and CVAA mercury analyses were assessed to ascertain whether the holding time requirements were met by the laboratory. The holding time requirements are as follows: samples must be analyzed within 28 days for mercury, 14 days for cyanide and within six months for all other metals.

All holding time requirements for all analytes in all data packages reviewed were met.

5.3 INSTRUMENT PERFORMANCE AND CALIBRATIONS

Performance of specific instrument quality assurance and quality control procedures, including deficiencies noted during the quality assurance review, are outlined below.

Three calibration standards and a blank were analyzed for arsenic, lead, selenium and thallium by GFAA. The correlation coefficient of a least squares linear regression met the requirements for calibration in all cases.

Up to five calibration standards and a blank were analyzed for mercury by CVAA. The correlation coefficient of a least squares linear regression met the requirements for calibration.

At least one standard and a blank were analyzed by ICP for all other elements.

The above calibrations were each immediately verified with an ICV standard and a calibration blank. The ICV was prepared from a source independent of the calibration standards, at a mid-calibration range concentration. The ICV percent recovery must fall within the control limits of 90 to 110 percent for metals analyzed by ICP and GFAA, and 80 to 120 percent for mercury. Calibration linearity near the detection limit was

verified with a standard prepared at a concentration near the CRDL.

The ICVs met the recommended control limits in all cases.

The calibrations were subsequently verified at regular intervals using a CCV standard. The control windows for percent recovery of CCV standards are the same as the ICV windows described above.

The CCVs met the recommended control limits in all cases.

A midpoint standard distillation was not performed for the cyanide analysis and the associated result was, therefore, qualified as an estimate and flagged "J" for the following sample:

- Sample number B08YB1 in SDG No. B08YB1.

All other midpoint standard distillation for the cyanide analysis were performed.

5.3.1 ICP Calibration

An ICS was analyzed at the beginning and end of each ICP sample run to verify the laboratory interelement and background correction factors. Results for the ICS solution must fall within the control limit of ± 20 percent of the true value. Arsenic, lead, selenium and thallium were analyzed using a Thermo-Jarrell Ash ICP61E. Under USEPA CLP protocol, this is acceptable provided the ICP is able to meet the required detection limits and the analytical run follows the USEPA CLP protocol for ICP analysis. Under the ICP method, an ICS is required for lead at a concentration of 1.0 mg/L. Refer to Table 2, page E-14, of the USEPA CLP ILM01.0.

The ICS has been analyzed at the proper frequency and all ICSAB solution percent recovery values fell within the control limit with the following exception. An ICS was not analyzed for lead and the associated results were, therefore, rejected and flagged "R" for the following samples:

- Sample numbers B08Y91, B08YC5, B08YD0 and B08YD5 in SDG No. B08Y91.
- Sample numbers B08Y92, B08YC6, B08YD1 and B08YD6 in SDG No. B08Y92.

A five-fold serial dilution is required for all elements analyzed by ICP. The subsequent concentrations of the reanalysis are compared with the original analysis. If the analyte concentration is sufficiently high (a minimum factor of 50 above the IDL) then the serial dilution must agree within 10% of the original determination after correction for dilution.

5.3.2 Atomic Absorption Calibrations

Duplicate injections are required for all GFAA analyses. The duplicate injections establish the precision of the individual analytical determinations. For sample concentrations greater than the CRDL, duplicate injections must agree within ± 20 percent RSD or CV. The AA calibration results are discussed further in Section 5.7 of this report.

5.4 BLANKS

5.4.1 Positive Blank Results

In the case of positive blank results, samples with digestate concentrations (in ug/L) of less than five times ($< 5x$) the highest amount found in any of the associated blanks have had their associated values qualified as non-detected and flagged "U". Samples with concentrations of greater than five times ($> 5x$) the highest amount found in any of the associated blanks do not require qualification.

Due to the presence of laboratory blank contamination, the following samples were flagged "U" for aluminum:

- Sample numbers B08Y41 and B08Y56 in SDG No. B08Y41.
- Sample number B08YD5 in SDG No. B08Y91.
- Sample number B08YB2 in SDG No. B08YB1.

Due to the presence of laboratory blank contamination, the following samples were flagged "U" for calcium:

- Sample numbers B08YD1 and B08YD6 in SDG No. B08Y92.

Due to the presence of laboratory blank contamination, the following samples were flagged "U" for cobalt:

- Sample number B08Y56 in SDG No. B08Y41.
- Sample number B08Y62 in SDG No. B08Y42.
- Sample number B08Y77 in SDG No. B08Y77.

Due to the presence of laboratory blank contamination, the following samples were flagged "U" for copper:

- Sample number B08Y42 in SDG No. B08Y42.
- Sample number B08Y91 in SDG No. B08Y91.
- Sample number B08Y92 in SDG No. B08Y92.

Due to the presence of laboratory blank contamination, the following samples were flagged "U" for iron:

- Sample numbers B08Y41, B08Y51, B08Y56 and B08Y61 in SDG No. B08Y41.
- Sample numbers B08Y42, B08Y52, B08Y62 and B08Y67 in SDG No. B08Y42.
- Sample numbers B08Y76 and B08YC0 in SDG No. B08Y76.
- Sample number B08Y77 in SDG No. B08Y77.
- Sample numbers B08Y91, B08YD0 and B08YD5 in SDG No. B08Y91.

Due to the presence of laboratory blank contamination, the following samples were flagged "U" for manganese:

- Sample numbers B08Y41, B08Y51, B08Y56 and B08Y61 in SDG No. B08Y41.
- Sample numbers B08Y52 and B08Y62 in SDG No. B08Y42.
- Sample numbers B08Y91, B08YC5 and B08YD5 in SDG No. B08Y91.
- Sample numbers B08Y92, B08YC6, B08YD1 and B08YD6 in SDG No. B08Y92.

Due to the presence of laboratory blank contamination, the following samples were flagged "U" for selenium:

- Sample numbers B08Y91, B08YC5, B08YD0 and B08YD5 in SDG No. B08Y91.
- Sample numbers B08Y92, B08YC6 and B08YD1 in SDG No. B08Y92.
- Sample numbers B08YB1 and B08YB2 in SDG No. B08YB1.

Due to the presence of laboratory blank contamination, the following samples were flagged "U" for sodium:

- Sample numbers B08YD0 and B08YD5 in SDG No. B08Y91.
- Sample numbers B08YD1 and B08YD6 in SDG No. B08Y92.

Due to the presence of laboratory blank contamination, the following samples were flagged "U" for vanadium:

- Sample numbers B08YB5 and B08YB6 in SDG No. B08YB5.

Due to the presence of laboratory blank contamination, the following samples were flagged "U" for zinc:

- Sample number B08Y51 in SDG No. B08Y41.

- Sample number B08Y91 in SDG No. B08Y91.
- Sample number B08YC6 in SDG No. B08Y92.
- Sample number B08YB1 in SDG No. B08YB1.

All other laboratory blank results were acceptable.

5.4.2 Negative Blank Results

In the case of negative blank results, if the absolute value of any calibration blank exceeds the Instrument Detection Limit (IDL), all non-detects are qualified as estimates and flagged "J", and all positive results within two times the absolute value of the blank result are qualified as estimates and flagged "J". In the case of preparation blanks, if the absolute value exceeds the Contract Required Detection Limit (CRDL), all non-detects are rejected and flagged "R" and all detected that are less than ten times the absolute value of the preparation blank result are qualified as estimates and flagged "J".

Due to the presence of negative laboratory contamination, the following samples were flagged "J" for calcium:

- Sample numbers B08Y41, B08Y51, B08Y56, B08Y61 and B08Y66 in SDG No. B08Y41.
- Sample numbers B08YD0 and B08YD5 in SDG No. B08Y91.

Due to the presence of negative laboratory contamination, the following samples were flagged "J" for chromium:

- Sample numbers B08Y41, B08Y51 and B08Y61 in SDG No. B08Y41.
- Sample numbers B08Y76 and B08YC0 in SDG No. B08Y76.
- Sample numbers B08Y77 and B08YC1 in SDG No. B08Y77.
- Sample numbers B08Y92, B08YC6, B08YD1 and B08YD6 in SDG No. B08Y92.

Due to the presence of negative laboratory contamination, the following samples were flagged "J" for copper:

- Sample numbers B08Y41, B08Y51, B08Y56, B08Y61 and B08Y66 in SDG No. B08Y41.
- Sample numbers B08Y76 and B08YC0 in SDG No. B08Y76.

Due to the presence of negative laboratory contamination, the following samples were flagged "J" for iron:

- Sample numbers B08Y92, B08YC6, B08YD1 and B08YD6 in SDG No. B08Y92.

Due to the presence of negative laboratory contamination, the following samples were flagged "J" for sodium:

- Sample numbers B08Y76 and B08YC0 in SDG No. B08Y76.

Due to the presence of negative laboratory contamination, the following samples were flagged "J" for zinc:

- Sample numbers B08Y41, B08Y51, B08Y56, B08Y61 and B08Y66 in SDG No. B08Y41.
- Sample numbers B08Y42, B08Y52, B08Y57, B08Y62 and B08Y67 in SDG No. B08Y42.
- Sample numbers B08Y76 and B08YC0 in SDG No. B08Y76.

5.5 ACCURACY

5.5.1 Matrix Spike Recovery

Matrix spike analyses are used to assess the analytical accuracy of the reported data and the effect of the matrix on the ability to accurately quantify sample concentrations. Matrix spike recoveries must generally fall within the range of 75 to 125 percent. Samples with a spike recovery of less than 30% and a sample value below the IDL were rejected and flagged "R". All other samples with a spike recovery outside the QC limits are qualified as estimates and flagged "J".

The matrix spike recovery fell outside the QC limits and the associated results flagged "J" for lead in the following samples:

- Sample numbers B08Y41, B08Y51, B08Y56, B08Y61 and B08Y66 in SDG No. B08Y41.

The matrix spike recovery fell outside the QC limits and the associated results flagged "J" for thallium in the following samples:

- Sample numbers B08Y41, B08Y51, B08Y56, B08Y61 and B08Y66 in SDG No. B08Y41.
- Sample numbers B08Y42, B08Y52, B08Y57, B08Y62 and B08Y67 in SDG No. B08Y42.
- Sample numbers B08Y77 and B08YC1 in SDG No. B08Y77.

The matrix spike recovery fell below the 30% QC recovery limit and the associated results flagged "R" for selenium in the following samples:

- Sample numbers B08YB1 and B08YB2 in SDG No. B08YB1.

The matrix spike recovery fell below the 30% QC recovery limit and the associated results flagged "R" for thallium in the following samples:

- Sample numbers B08Y76 and B08YC0 in SDG No. B08Y76.

All other matrix spike recovery results were acceptable.

5.5.2 Laboratory Control Sample Recovery

The LCS monitors the overall performance of the analysis, including the sample preparation. An LCS should be digested or distilled and analyzed with every group of samples which have been prepared together. The performance criteria for solid LCS samples are established through interlaboratory studies coordinated by a certifying agency (e.g., EPA or an independent commercial supplier).

One liquid LCS was digested and analyzed for each of the cases in this report that contained water samples. The results were compared against the control limit of 80-120% as required by the EPA CLP SOW 3/90 protocol and found to be acceptable.

All LCSW results were found to be acceptable.

5.6 PRECISION

5.6.1 Laboratory Duplicate Samples

The laboratory duplicate results measures the precision of the method by measuring a second aliquot of the sample that is treated the same way as the original. Samples whose precision fell outside the quality control requirements were flagged as estimates "J".

All laboratory duplicate recovery results were acceptable.

5.6.2 ICP Serial Dilution

The ICP serial dilution is used to determine whether significant physical or chemical interferences exist due to sample matrix. If sample concentration is ≥ 50 times the IDL for an analyte and the %D is outside the control limits the associated data must be qualified as estimates "J".

All ICP serial dilution results were acceptable.

5.6.3 Total and Dissolved Sample Analysis

Inorganics parameters included the analysis of the total as well as dissolved samples. Total samples include particulate and dissolved fractions while dissolved samples are first filtered prior to preparation. The purpose of the analysis is to determine what metals are inherent in the particulate matter found in the aqueous sample.

Since Westinghouse Validation Guidelines do not address this issue, the total and dissolved samples are presented in the report, but no judgement on the data was made.

Below is a table of the total and dissolved samples which were validated.

<u>Total</u>	<u>Dissolved</u>
B08Y41	B08Y42
B08Y51	B08Y52
B08Y56	B08Y57
B08Y61	B08Y62
B08Y66	B08Y67
B08Y76	B08Y77
B08Y91	B08Y92
B08YB1	B08YB2
B08YB5	B08YB6
B08YC0	B08YC1
B08YC5	B08YC6
B08YD0	B08YD1
B08YD5	B08YD6

The lead results for dissolved sample B08Y57 exceeded the lead results for total sample B08Y56 with a percent difference greater than 50.0. However, no qualification of the samples was made as per Westinghouse-Hanford data validation guidelines.

5.7 FURNACE AA QUALITY CONTROL

The post-digestion analytical spike is analyzed to determine the extent of interference in the digestate matrix. When the results of the analytical spike analyses exceeds the control window of 85 to 115 percent recovery and the absorbance of the sample is greater than fifty percent of the analytical spike absorbance, then the sample must be reanalyzed using the MSA. The duplicate injections and the analytical spike recoveries establish the precision and accuracy of the individual GFAA determinations.

5.7.1 Duplicate Injections

Each furnace analysis requires a minimum of two injections (burns), except for full Method of Standard Addition (MSA). For

WHC-SD-EN-TI-211, Rev. 0

concentrations greater than CRDL, the duplicate injection readings must agree within 20% relative standard deviation (RSD) or coefficient of variation (CV). If these requirements are not met, the analytical sample must be rerun once (i.e., two additional burns). If the readings are then still outside the QC limits, the result is qualified as an estimate and flagged "J".

All duplicate injection quality control requirements were met.

5.7.2 Analytical Spike Recoveries

For all samples whose analytical spike results are outside the 85 to 115 percent control limit, but whose absorbances are less than 50 percent of the analytical spike absorbance, the samples were flagged as estimates "J". In cases where the analytical spike recovery was 0.0 percent, the results were rejected and flagged "R".

The analytical spike recovery fell outside the established QC limits and the associated results flagged "J" for arsenic in the following samples:

- Sample numbers B08Y42, B08Y52, B08Y57 and B08Y62 in SDG No. B08Y42.

The analytical spike recovery fell outside the established QC limits and the associated results flagged "J" for lead in the following samples:

- Sample numbers B08Y56 and B08Y61 in SDG No. B08Y41.
- Sample numbers B08Y76 and B08YC0 in SDG No. B08Y76.
- Sample numbers B08YB1 and B08YB2 in SDG No. B08YB1.
- Sample numbers B08YB5 and B08YB6 in SDG No. B08YB5.

The analytical spike recovery fell outside the established QC limits and the associated results flagged "J" for selenium in the following samples:

- All samples in SDG No. B08Y41.
- Sample numbers B08Y52, B08Y57 and B08Y62 in SDG No. B08Y42.
- Sample number B08Y76 in SDG No. B08Y76.
- Sample number B08Y77 in SDG No. B08Y77.

The analytical spike recovery fell outside the established QC limits and the associated results flagged "J" for thallium in the following samples:

- All samples in SDG No. B08Y41.
- Sample numbers B08Y52 and B08Y67 in SDG No. B08Y42.
- Sample numbers B08Y76 and B08YC0 in SDG No. B08Y76.
- Sample numbers B08Y77 and B08YC1 in SDG No. B08Y77.

An analytical spike was not performed during the GFAA analysis of arsenic, selenium and thallium for sample numbers B08YB1 and B08YB2 in SDG No. B08YB1. Westinghouse-Hanford protocol requires that we follow the USEPA CLP SOW 788 or 390 protocol, as a result both samples have been qualified as estimates and flagged "J".

All other analytical spike recovery results were acceptable.

5.7.3 Method of Standard Addition (MSA) Results

For all samples whose analytical spike results are outside the 85 to 115 percent control limit and whose absorbances are greater than 50 percent of the analytical spike absorbance an MSA is required. In cases where the MSA correlation coefficient was less than 0.995 the MSA analysis was repeated once. If the correlation coefficient was still less than 0.995, samples were flagged as estimates "J".

All MSA results were acceptable.

5.8 ANALYTE QUANTITATION AND DETECTION LIMITS

Twenty percent of sample results and reported detection limits were recalculated to ensure that the reported results were accurate. Raw data were examined for anomalies, transcription errors, and reduction errors.

The reviewer verified that the results and detection limits fell within the linear range of the instrument.

5.9 OVERALL ASSESSMENT AND SUMMARY

All samples were analyzed and reported under the 1990 CLP protocol (EPA 1990). Several inconsistencies and deviations from the protocol were observed. They are as follows:

A CCV and CCB must be analyzed immediately after the ICV and ICB. ICAP and Mercury do not follow this protocol. For ICAP analysis a CCV and CCB were run after the initial interference checks and CRI. This is incorrect because the ICSA/AB and CRII are considered analytical samples and according to the CLP protocol a CCV and CCB must be run prior to any analytical samples. For mercury, the CCV and CCB were analyzed for after

the first ten samples. Refer to Sections E-11 paragraph 5b and E-15 paragraph 4a of the EPA CLP SOW 3/90 protocol.

Internal Chains of Custody lacked sufficient information such as interdepartmental transfers, i.e., from the sample custodian to the technician responsible for sample preparation and the dates these transfers took place plus the EPA sample ID number. Without this information Internal Chains of Custody can not be verified as those belonging to samples in this report. Refer to Sections F-5, paragraph 1.5 and F-3, paragraph 1.4 of the EPA CLP SOW 3/90 protocol.

For samples analyzed by Roy F. Weston, incorrect ICP instrument detection limits (IDL's) are being used to report results down to the IDL. Two sets of IDL's (Form 10) are included in the data package for ICAP analysis, one for instrument IC1 and one for instrument IC3. According to the case narrative addendum, Roy F. Weston states that the highest IDL of the two instruments is used as per Exhibit E, Section V, Item 10 (pg. E-53) of the EPA Statement of Work for Inorganics Analysis, Document Number ILM01.0. This is correct only when two instruments are being used to determine sample results within a data package. However, in this data package Roy F. Weston used only one ICP instrument to determine the sample results and therefore it is that instrument's IDL's which should be used to calculate results. According to Form XIV information IC1 is the instrument being used for analysis while the IDL's of IC3 are the ones reported on Forms 1-9. This can effect results flagged "U" or results which may be flagged "U" because of laboratory blank contamination.

All raw data associated with Roy F. Weston have not been labeled with the client (EPA) ID number. Results labeled with only the laboratory sample ID number is insufficient. Refer to Section B-10 of the EPA CLP SOW 390.

Except as noted in the preceding sections, all other validated data are usable for all purposes.

6.0 WET CHEMISTRY DATA VALIDATION

6.1 DATA PACKAGE COMPLETENESS

The following data packages (SDG Nos.) were submitted for validation and found to be complete:

B08Y15	B08Y44	B08Y91	B08YB1
B08Y41	B08Y76	B08Y94	B08YB5

6.2 HOLDING TIMES

Analytical holding times for alkalinity, ammonia, nitrogen, chloride, COD, fluoride, hydrazine, nitrate-nitrite, pH, phosphate, specific conductance, sulfate, sulfide, TDS, TOC and TOX were assessed to ascertain whether the holding time requirements were met by the laboratory. The holding time requirements are as follows: 28 days for ammonia-nitrogen, chloride, COD, fluoride, NO₃NO₂, specific conductance, sulfate and TOC; 14 days for alkalinity and hydrazine; seven days for sulfide, TDS and TOX; 72 hours for pH; and 48 hours for phosphate.

The 72-hour holding time for pH was exceeded and all associated results were flagged "J" in the following samples:

- Sample numbers B08Y41, B08Y51, B08Y56, B08Y61 and B08Y66 in SDG No. B08Y41.
- Sample numbers B08Y76 and B08YC0 in SDG No. B08Y76.
- Sample numbers B08Y91, B08YC5, B08YD0 and B08YD5 in SDG No. B08Y91.
- Sample number B08YB5 in SDG No. B08YB5.

The 48-hour holding time for phosphate was exceeded and the associated results were flagged "J" in the following samples:

- Sample number B08YB1 in SDG No. B08YB1.
- Sample number B08YB5 in SDG No. B08YB5.

The 14-day holding time for hydrazine was exceeded and all associated results were flagged "J" in the following samples:

- All samples in SDG No. B08Y15.

The 48-hour holding time for phosphate was grossly exceeded and all associated results were rejected and flagged "R" in the following samples:

- Sample numbers B08Y41, B08Y51, B08Y56, B08Y61 and B08Y66 in SDG No. B08Y41.
- Sample numbers B08Y76 and B08YC0 in SDG No. B08Y76.
- Sample numbers B08Y91, B08YC5, B08YD0 and B08YD5 in SDG No. B08Y91.

Holding times for all other analytes reviewed met QC requirements.

6.3 CALIBRATIONS

The laboratory failed to check the titrant normality for the alkalinity analyses in SDG Nos. B08Y41, B08Y76, B08Y91, B08YB1 and B08YB5. All associated results were rejected and flagged "R".

6.3.1 Initial Calibration

The following calibration procedures must be conducted:

- At least a blank and three standards were used to establish the ion chromatography, ion selective electrode, spectrophotometer, TOC analyzer and TOX analyzer calibrations prior to sample analysis and the correlation was ≥ 0.995 .

Instrument calibrations were not performed for the sulfide, COD and electrical conductivity analyses in SDG Nos. B08Y41 and B08Y91. All associated results were rejected and flagged "R".

Instrument calibrations were not performed for the TOX analyses in SDG Nos. B08Y44, B08Y76, B08Y94, B08YB1 and B08YB5. All associated results were rejected and flagged "R".

Insufficient instrument calibrations were performed for the TOC analyses in SDG Nos. B08Y44, B08Y76 and B08Y91. All associated results were qualified as estimates and flagged "J".

Instrument calibrations were not performed for the sulfide, COD, electrical conductivity and ammonia-nitrogen analyses in SDG Nos. B08Y76 and B08Y91. All associated results were rejected and flagged "R".

Instrument calibration verification was not performed for sulfide analysis in SDG Nos. B08YB1 and B08YB5. All associated results were estimated and flagged "J".

All other initial calibration results were acceptable.

6.3.2 Continuing Calibration Verification

All CCV standards must be analyzed with the required frequency or every 20 samples. The percent recoveries must fall within the 90-110% acceptance windows.

The laboratory failed to perform a ICV/CCV analyses for the ammonia-nitrogen and TOC analyses for SDG No. B08Y41. All associated results were qualified as estimates and flagged "J".

The laboratory failed to perform an ICV for the sulfide analyses for SDG Nos. B08YB1 and B08YB5. All associated results were qualified as estimates and flagged "J".

The CCV %R exceeded the 110% acceptance window for nitrate-nitrite analysis for SDG Nos. B08Y41 and B08Y76. All associated results were qualified as estimates and flagged "J".

All other continuing calibration results were acceptable.

6.4 BLANKS

One laboratory preparation blank is analyzed at a frequency of one every 20 samples. All blank results must fall below the CRQL and if not, all associated data <5 times the amount found in the blank are qualified as non-detected "U".

Due to laboratory blank contamination, sample number B08Y59 in SDG No. B08Y44 was qualified as non-detected and flagged "U" for organic chloride (TOX).

A method blank was not analyzed for nitrate/nitrite, TOC and specific conductance analyses for sample number B08YB1 in SDG No. B08YB1. All associated results were qualified as estimates and flagged "J".

A method blank was not analyzed for COD, TOC, specific conductance and nitrate-nitrite for sample number B08YB5 in SDG No. B08YB5. All associated results were qualified as estimates and flagged "J".

All other laboratory blank results were acceptable.

6.5 ACCURACY

6.5.1 Matrix Spike Recovery

Matrix spike analyses are used to assess the analytical accuracy of the reported data and the effect of the matrix on the ability to accurately quantify sample concentrations.

The matrix spike recovery for organic bromide (TOX) fell below the QC limits and were qualified as estimates and flagged "J" for the following:

- Sample numbers B08Y94, B08YC8, B08YD3 and B08YD8 in SDG No. B08Y94.

The matrix spike recovery for nitrate/nitrate analysis fell below the QC limits and all associated sample results were qualified as estimates and flagged for the following:

- Sample numbers B08Y41, B08Y51, B08Y56, B08Y61 and B08Y66 in SDG No. B08Y41.

The matrix spike recovery for phosphate fell below the limit and the associated sample result qualified as an estimate and flagged "J" for sample number B08YB5 in SDG No. B08YB5.

All other matrix spike results were acceptable.

6.5.2 Laboratory Control Sample Recovery

The LCS monitors the overall performance of the analysis, including the sample preparation. An LCS should be prepared (e.g., digested or distilled) and analyzed with every group of samples which have been prepared together. The performance criteria for aqueous LCS percent recovery is 80 to 120 percent. The performance criteria for solid LCS samples are established through interlaboratory studies coordinated by a certifying agency (e.g., EPA or an independent commercial supplier).

An LCS was not analyzed for COD, TOC, nitrate/nitrite and specific conductance for sample number B08YB1 in SDG No. B08YB1. All associated results were qualified as estimates and flagged "J".

An LCS was not analyzed for COD, TOC, sulfide, ammonia, specific conductance and nitrate-nitrite for sample number B08YB5 in SDG No. B08YB5. All associated results were qualified as estimates and flagged "J".

ICV results obtained from the raw data were used to calculate LCS results. All other LCS results were found to be acceptable.

6.6 PRECISION

Analytical duplicate sample analyses are used to measure laboratory precision and sample homogeneity. Field duplicate analyses are used to measure both the laboratory and the field sampling procedure precision.

All duplicate analyses results were acceptable for this data.

6.7 ANALYTE QUANTITATION AND DETECTION LIMITS

Sample results and reported detection limits were recalculated to ensure that the reported results were accurate. Raw data were examined for anomalies, transcription errors, and reduction errors. In addition, the reviewer verified that the results fell within the linear range of the instrument.

6.8 OVERALL ASSESSMENT AND SUMMARY

A review of instrument continuing calibration information and QC data indicate that instrument performance was adequate for most analyses. Holding times were exceeded for pH, phosphate and hydrazine in several samples and grossly exceeded for phosphate analyses in one SDG. Instrument calibrations were either missing entirely or insufficiently for sulfide, COD, electrical conductivity, ammonia-nitrogen and TOX analyses in a majority of the data packages. In cases where instrument calibrations had not been performed, results were rejected. Sample results were qualified as estimates when instrument calibration data were incomplete. Rejected results are not usable for any purpose and should not be reported. Estimated results are usable for limited purposes only. All other validated results are considered accurate within the standard error associated with the methods.

7.0 GROSS ALPHA AND GROSS BETA DETERMINATION DATA VALIDATION**7.1 DATA PACKAGE COMPLETENESS**

The following data packages (SDG Nos.) were submitted for validation and found to be complete:

B08Y11 B08Y26 B08YB1 B08YB5

7.2 HOLDING TIMES

Holding times are calculated from Chain-of-Custody forms to determine the validity of the results. The maximum holding time for this analysis is six months.

All holding times were acceptable.

7.3 INSTRUMENT CALIBRATION AND PERFORMANCE

Instrument calibration is performed to establish that the gas proportional counter used for gross alpha and gross beta determination is capable of producing acceptable and reliable analytical data. The initial calibration was performed according to manufacturer's recommendations and consists of an instrument efficiency determination as a function of alpha or beta particle energy, and as a function of the mass of material submitted for counting. Continuing calibration checks are performed to verify that instrument performance is stable and reproducible on a day-to-day basis.

The initial calibration performed for the analysis was not detector-specific, therefore, all associated gross alpha and gross beta results in SDG Nos. B08Y11 and B08Y26 were rejected and flagged "R".

The calibration information submitted was dated after sample analysis for all samples associated with SDG No. B08Y11. All associated gross alpha and gross beta sample results were rejected and flagged "R".

No daily check source was submitted for all samples associated with SDG Nos. B08Y11 and B08Y26. All associated sample results were rejected and flagged "R".

The check source was not identified for all gross alpha and gross beta results associated with SDG Nos. B08Y11, B08Y26,

WHC-SD-EN-TI-211, Rev. 0

B08YB1 and B08YB5. All associated sample results were qualified as estimates and flagged "J".

All missing data were requested but were not available.

All other calibration results, including efficiency checks and background counts, were acceptable.

7.4 ACCURACY

Accuracy was evaluated by analyzing soil or distilled water samples spiked with known amounts of alpha or beta emitting radionuclides. The sample activity as determined by analysis is compared to the known activity to assess accuracy. Acceptable accuracy of spiked sample data must fall within a range of 80 to 120 percent. If spiked sample results were outside this range, the associated data were qualified as estimated and flagged "J/UJ".

Due to a low LCS recovery, the gross alpha results for all samples in SDG No. B08Y26 were qualified as estimates and flagged "J".

All other accuracy results were acceptable.

7.5 PRECISION

Analytical precision is expressed by the RPD between the recoveries of duplicate matrix spike analyses performed on a sample. When the laboratory has not performed duplicate spike analyses, precision may also be assessed using unspiked duplicate sample analyses. Replicates with activities greater than five times the LLD and with an RPD less than 35 percent are acceptable. If duplicate activities for one or both are $<5 \times \text{LLD}$, a control limit of $2 \times \text{LLD}$ is used. If replicate values are both below the LLD, no control limit is applicable. If the RPD is outside the applicable control limit, associated results are qualified as estimated detects and flagged "J" or estimated non-detects and flagged "UJ".

The gross beta RPD results were outside of QC limits for all samples in SDG Nos. B08Y11 and B08Y26. All associated sample results were qualified as estimates and flagged "J".

All other precision results were acceptable.

7.6 BLANK SAMPLES

Blank samples are analyzed to determine if positive results are due to laboratory reagent, sample container, or detector contamination.

WHC-SD-EN-TI-211, Rev. 0

Due to blank contamination, gross beta results in sample numbers B08Y11, B08Y16, B08Y21, B08Y81, B08Y86 and B08Y91 in SDG No. B08Y11 were qualified as estimates and flagged "J".

All other blank results were acceptable.

7.7 ANALYTE QUANTITATION AND REPORTED DETECTION LIMITS

Analyte quantitation and detection limits were recalculated for all samples in each data package to verify their accuracy.

All analyte quantitation and reported detection limits were acceptable.

7.8 OVERALL ASSESSMENT AND SUMMARY

A review of QC data indicates that instrument performance was adequate, except where noted above. All gross alpha and gross beta results in two SDGs were rejected and flagged "R" due to calibration problems. All rejected data are unusable for all purposes. All gross alpha and gross beta results were qualified as estimates and flagged "J" for all samples in all SDGs since daily check sources were not identified. Due to low LCS results, all gross alpha results in one SDG were qualified as estimates and flagged "J". All gross beta results in two SDGs were qualified as estimates and flagged "J" due to RPD results outside of QC limits. Due to blank contamination, gross alpha results in several samples were qualified as estimates and flagged "J". Estimated data are considered usable for limited purposes only. All other QC data are considered to be acceptable and usable for all purposes.

WHC-SD-EN-TI-211, Rev. 0

8.0 ALPHA SPECTROSCOPY DATA VALIDATION**8.1 DATA PACKAGE COMPLETENESS**

The following data packages (SDG Nos.) were submitted for validation and found to be complete:

B08Y11 B08Y26 B08YB1 B08YB5

8.2 HOLDING TIMES

Holding times are calculated from Chain-of-Custody forms to determine the validity of the results. The maximum holding time for this analysis is six months.

All holding times were acceptable.

8.3 INSTRUMENT CALIBRATION AND PERFORMANCE

Instrument calibration is performed to establish that the alpha spectroscopy system used is capable of producing acceptable and reliable analytical data. The initial calibration was performed according to manufacturer's recommendations and consists of an instrument efficiency determination for each alpha radionuclide region of interest, and a system resolution assessment as measured by the full-width at half maximum for each peak. Initial calibration was performed for each counting geometry used during the analysis of Westinghouse-Hanford samples. Continuing calibration checks are performed to verify that instrument performance is stable and reproducible on a day-to-day basis.

Peak width (resolution) in the annual calibration was above the 20 KeV control limit for SDG Nos. B08YB1 and B08YB5. All associated alpha spectroscopy results were qualified as estimates and flagged "J".

No daily check source was submitted for all alpha spectroscopy sample results in SDG Nos. B08Y11, B08Y26, B08YB1 and B08YB5. All associated sample results were rejected and flagged "R".

The check source was not identified for all alpha spectroscopy sample results in SDG Nos. B08Y11, B08Y26, B08YB1 and B08YB5. All associated results were qualified as estimates and flagged "J".

WHC-SD-EN-TI-211, Rev. 0

All missing data were requested but were not available.

All other calibration results, including efficiency checks and background counts, were acceptable.

8.4 ACCURACY

Accuracy was evaluated by analyzing soil or distilled water samples spiked with known amounts of alpha emitting radionuclides. The sample activity as determined by analysis is compared to the known activity to assess accuracy. The acceptable matrix spike or Laboratory Control Sample recovery range is 80 to 120 percent, while that for radiometric yields is 30 to 105%. Spike sample results outside the above ranges resulted in qualification of the associated data as estimated and flagged "J/UJ".

Due to low chemical yields, the isotopic plutonium results for sample numbers B08Y41, B08Y56, B08Y76 and B08YC0 in SDG No. B08Y26 were rejected and flagged "R".

Due to low chemical yields, the americium-241 results for all samples in SDG No. B08Y26 were rejected and flagged "R".

Due to high LCS recovery results, the plutonium-239/240 results for all samples in SDG No. B08Y26 were estimated and flagged "J".

Due to low LCS recovery results, the americium-241 results for all samples in SDG No. B08Y26 were estimated and flagged "J".

No LCS results were submitted for plutonium-238 in SDG Nos. B08Y11 and B08Y26. All associated results were estimated and flagged "J".

All other accuracy results were acceptable.

8.5 PRECISION

Analytical precision is expressed by the RPD between the recoveries of duplicate matrix spike analyses performed on a sample. When the laboratory has not performed duplicate spike analyses, precision may also be assessed using unspiked duplicate samples. Replicates with a RPD less than 35 percent are acceptable. If duplicate activities for one or both are <5xLLD, a control limit of 2xLLD is used. If replicate values are both below the LLD, no control limit is applicable. If the RPD is outside the applicable control limit, associated results are qualified as estimated detects and flagged "J" or estimated non-detects and flagged "UJ".

All precision results were acceptable.

WHC-SD-EN-TI-211, Rev. 0

8.6 BLANK SAMPLES

Blank samples are analyzed to determine if positive results are due to laboratory reagent, sample container, or detector contamination.

All blank results were acceptable.

8.7 ANALYTE QUANTITATION AND REPORTED DETECTION LIMITS

Analyte quantitations and detection limits were recalculated for all samples in each data delivery package to verify their accuracy.

All analyte quantitation and reported detection limits were acceptable.

8.8 OVERALL ASSESSMENT AND SUMMARY

A complete review of all QC and calibration data indicates that overall system performance was adequate. Due to low yields americium-241 and isotopic plutonium results in several samples were rejected and flagged "R". No daily check source was submitted for several samples in one SDG. All associated alpha spectroscopy results were rejected. Rejected results are unusable for all purposes. All alpha spectroscopy results from two SDGs were qualified as estimates due to peak widths outside control limits. The check source was not identified for all alpha spectroscopy results in all SDGs. All associated results were qualified as estimates and flagged "J". No LCS results were submitted for plutonium-238 in two SDGs. All associated results were estimated and flagged "J". LCS recovery results were outside of QC limits for plutonium-239/240 and americium-241 in one SDG. All associated results were qualified as estimates and flagged "J". Estimated results are usable for limited purposes only. All other QC data are considered to be acceptable and usable for all purposes.

WHC-SD-EN-TI-211, Rev. 0

9.0 GAMMA SPECTROSCOPY DATA VALIDATION**9.1 DATA PACKAGE COMPLETENESS**

The following data packages (SDG Nos.) were submitted for validation and found to be complete:

B08Y11 B08Y26 B08YB1 B08YB5

9.2 HOLDING TIMES

Holding times are calculated from Chain-of-Custody forms to determine the validity of the results. The maximum holding time for this analysis is six months.

All holding times were acceptable.

9.3 INSTRUMENT CALIBRATION AND PERFORMANCE

Instrument calibration is performed to establish that the gamma spectroscopy system used is capable of producing acceptable and reliable analytical data. The initial calibration was performed according to manufacturer's recommendations and consists of an instrument efficiency determination for each gamma radionuclide region of interest, and a system resolution assessment as measured by the full-width at half maximum for each peak. Initial calibration was performed for each counting geometry used during the analysis of Westinghouse-Hanford samples. Continuing calibration checks are performed to verify that instrument performance is stable and reproducible on a day-to-day basis.

No daily check source was submitted for all sample results in SDG Nos. B08Y11, B08Y26, B08YB1 and B08YB6. All associated sample results were rejected and flagged "R".

The check source was not identified for all gamma spectroscopy results in SDG Nos. B08Y11, B08Y26, B08YB1 and B08YB5. All associated results were qualified as estimates and flagged "J".

All missing data were requested but were not available.

All other calibration results, including efficiency checks and background counts, were acceptable.

WHC-SD-EN-TI-211, Rev. 0

9.4 ACCURACY

Accuracy was evaluated by analyzing soil or distilled water samples spiked with known amounts of gamma emitting radionuclides. The sample activity as determined by sample analysis is compared to the known activity to assess accuracy. The acceptable spiked recovery range is 80 to 120 percent. If spiked sample results were outside this range the associated data were qualified as estimated and flagged "J/UJ".

All accuracy results were acceptable.

9.5 PRECISION

Analytical precision is expressed by the RPD between the recoveries of duplicate matrix spike analyses performed on a sample. When the laboratory has not performed duplicate spike analyses, precision may also be assessed using unspiked duplicate sample analyses. Replicates with a RPD less than 35 percent are acceptable. If duplicate activities for one or both are $<5 \times \text{LLD}$, a control limit of $2 \times \text{LLD}$ is used. If replicate values are both below the LLD, no control limit is applicable. If the RPD is outside the applicable control limit, associated results are qualified as estimated detects and flagged "J" or estimated non-detects and flagged "UJ".

All precision results were acceptable.

9.6 BLANK SAMPLES

Blank samples are analyzed to determine if positive results may be due to laboratory reagent, sample container, or detector contamination.

All blank results were acceptable.

9.7 ANALYTE QUANTITATION AND REPORTED DETECTION LIMITS

Analyte quantitations and detection limits were recalculated for all samples in each data delivery package to verify their accuracy.

All analyte quantitation and reported detection limits were acceptable.

9.8 OVERALL ASSESSMENT AND SUMMARY

A review of instrument continuing calibration information and QC data indicates that instrument performance was adequate for these analyses. Daily check sources were not submitted for all samples in all SDGs. The associated sample results were

WHC-SD-EN-TI-211, Rev. 0

rejected and flagged "R". All rejected results are unusable for all purposes. Check source was not identified for all SDGs. All associated samples were estimated and flagged "J". Estimated data are considered usable for limited purposes only. All other QC data are considered to be acceptable and usable for all purposes.

WHC-SD-EN-TI-211, Rev. 0

10.0 STRONTIUM-90 DETERMINATION DATA VALIDATION**10.1 DATA PACKAGE COMPLETENESS**

The following data packages (SDG Nos.) were submitted for validation and found to be complete:

B08Y11 B08Y26 B08YB1 B08YB5

10.2 HOLDING TIMES

Holding times are calculated from Chain-of-Custody forms to determine the validity of the results. The maximum holding time for this analysis is six months.

All holding times were acceptable.

10.3 INSTRUMENT CALIBRATION AND PERFORMANCE

Instrument calibration is performed to establish that the low background counting system used for strontium-90 determination is capable of producing acceptable and reliable analytical data. The initial calibration was performed according to manufacturer's recommendations and consists of an instrument detection efficiency determination. Continuing calibration checks are performed to verify that instrument performance is stable and reproducible on a day-to-day basis.

The initial calibration was not detector-specific for strontium-90 in SDG Nos. B08Y11 and B08Y26. All associated sample results were rejected and flagged "R".

No daily check source was submitted for strontium-90 results in SDG Nos. B08Y11 and B08Y26. All associated sample results were rejected and flagged "R".

The check source was not identified for strontium-90 results in SDG Nos. B08Y11, B08Y26, B08YB1 and B08YB5. All associated sample results were estimated and flagged "J".

All missing data were requested but were not available.

All other calibration results, including efficiency checks and background counts, were acceptable.

WHC-SD-EN-TI-211, Rev. 0

10.4 ACCURACY

All spike recoveries should be within the specified QC range of 80 to 120 percent, while all radiotraced samples should show a radiometric yield or recovery between 90 and 105%. Spiked sample results outside the above ranges resulted in qualification of the associated data as estimated.

Due to high LCS recoveries, all strontium-90 results in SDG No. B08Y26 were qualified as estimates and flagged "J".

All other accuracy results were acceptable.

10.5 PRECISION

Analytical precision is expressed by the RPD between the recoveries of duplicate matrix spike analyses performed on a sample. When the laboratory has not performed duplicate spike analyses, precision may also be assessed using unspiked duplicate sample analyses. Replicates with an RPD less than 35 percent are acceptable. If duplicate activities for one or both are $<5 \times \text{LLD}$, a control limit of $2 \times \text{LLD}$ is used. If replicate values are both below the LLD, no control limit is applicable. If the RPD is outside the applicable control limit, associated results are qualified as estimated detects and flagged "J" or estimated non-detects and flagged "UJ".

All precision results were acceptable.

10.6 BLANK SAMPLES

Blank samples are analyzed to determine if positive results may be due to laboratory reagent, sample container, or detector contamination.

All blank results were acceptable.

10.7 ANALYTE QUANTITATION AND REPORTED DETECTION LIMITS

Analyte quantitation and detection limits were recalculated for all samples in each data delivery package to verify their accuracy.

All analyte quantitation and reported detection limits were acceptable.

10.8 OVERALL ASSESSMENT AND SUMMARY

A review of instrument continuing calibration information and QC data indicates that instrument performance was adequate for these analyses. The initial calibration was not detector-

WHC-SD-EN-TI-211, Rev. 0

specific for two SDGs. All associated sample results were rejected and flagged "R". No daily check source was submitted for two SDGs. All associated sample results were rejected and flagged "R". All rejected results are unusable for all purposes. The check source was not identified for all SDGs. All associated sample results were estimated and flagged "J". Due to high LCS recovery results, all strontium-90 results in one SDG were qualified as estimates and flagged "J". Estimated data are considered usable for limited purposes only. All other QC data are considered to be acceptable and usable for all purposes.

WHC-SD-EN-TI-211, Rev. 0

11.0 TECHNETIUM-99 DETERMINATION DATA VALIDATION**11.1 DATA PACKAGE COMPLETENESS**

The following data package (SDG Nos.) were submitted for validation and found to be complete:

B08Y11 B08Y26 B08YB1 B08YB5

11.2 HOLDING TIMES

Holding times are calculated from Chain-of-Custody forms to determine the validity of the results. The maximum holding time for this analysis is six months.

All holding times were acceptable.

11.3 INSTRUMENT CALIBRATION AND PERFORMANCE

Instrument calibration is performed to establish that the low background counting system used for technetium-99 determination is capable of producing acceptable and reliable analytical data. The initial calibration was performed according to manufacturer's recommendations and consists of an instrument detection efficiency determination. Continuing calibration checks are performed to verify that instrument performance is stable and reproducible on a day-to-day basis.

Initial calibration submitted was not detector-specific for all technetium-99 results in SDG Nos. B08Y11 and B08Y26. All associated results were rejected and flagged "R".

No daily check source was provided for all technetium-99 results in SDG No. B08Y11. All associated results were rejected and flagged "R".

The check source was not identified for all technetium-99 results in SDG Nos. B08YB1 and B08YB5. All associated results were qualified as estimates and flagged "J".

All missing data were requested but were not available.

All other calibration results, including efficiency checks and background counts, were acceptable.

WHC-SD-EN-TI-211, Rev. 0

11.4 ACCURACY

All spike recoveries should be within the specified QC range of 80 to 120 percent, while all radiotraced samples should show a radiometric yield or recovery between 30 and 105%. Spiked sample results outside the above ranges resulted in qualification of the associated data as estimated.

All accuracy results were acceptable.

11.5 PRECISION

Analytical precision is expressed by the RPD between the recoveries of duplicate matrix spike analyses performed on a sample. When the laboratory has not performed duplicate spike analyses, precision may also be assessed using unspiked duplicate sample analyses. Replicates with an RPD less than 35 percent are acceptable. If duplicate activities for one or both are $<5 \times \text{LLD}$, a control limit of $2 \times \text{LLD}$ is used. If replicate values are both below the LLD, no control limit is applicable. If the RPD is outside the applicable control limit, associated results are qualified as estimated detects and flagged "J" or estimated non-detects and flagged "UJ".

All precision results were acceptable.

11.6 BLANK SAMPLES

Blank samples are analyzed to determine if positive results may be due to laboratory reagent, sample container, or detector contamination.

Due to blank contamination, all technetium-99 results in SDG No. B08Y11 were qualified as estimates and flagged "J".

All other blank results were acceptable.

11.7 ANALYTE QUANTITATION AND REPORTED DETECTION LIMITS

Analyte quantitation and detection limits were recalculated for all samples in each Jta delivery package to verify their accuracy. All analyte quantitation and reported detection limits were acceptable.

11.8 OVERALL ASSESSMENT AND SUMMARY

A review of instrument continuing calibration information and QC data indicates that instrument performance was adequate for these analyses. Initial calibration submitted was not detector-specific for all technetium-99 results in two SDGs. All associated results were rejected and flagged "R". No daily check

WHC-SD-EN-TI- 211, Rev. 0

source was provided for one SDG. All associated technetium-99 results were rejected and flagged "R". All rejected results are unusable for all purposes. The check source was not identified for two SDGs. All associated technetium-99 results were qualified as estimates and flagged "J". Due to blank contamination, all technetium-99 samples were qualified as estimates in one SDG. Estimated data are considered usable for limited purposes only. All other QC data are considered to be acceptable and usable for all purposes.

WHC-SD-EN-TI-211, Rev. 0

12.0 CARBON-14 DETERMINATION DATA VALIDATION**12.1 DATA PACKAGE COMPLETENESS**

The following data packages (SDG Nos.) were submitted for validation and found to be complete:

B08Y11 B08Y26 B08YB1 B08YB5

12.2 HOLDING TIMES

Holding times are calculated from Chain-of-Custody forms to determine the validity of the results. The maximum holding time for this analysis is six months.

All holding times were acceptable.

12.3 INSTRUMENT CALIBRATION AND PERFORMANCE

Instrument calibration is performed to establish that the low background liquid scintillation counting system used for carbon-14 determination is capable of producing acceptable and reliable analytical data. The initial calibration was performed according to manufacturer's recommendations and consists of an instrument efficiency determination for each applicable radionuclide. Continuing calibration checks are performed to verify that instrument performance is stable and reproducible on a day-to-day basis.

No daily check source was submitted for all carbon-14 results in SDG Nos. B08Y11 and B08Y26. All associated results were rejected and flagged "R".

The daily check source was not identified for carbon-14 results in SDG Nos. B08Y11, B08Y26, B08YB1 and B08YB5. All associated results were qualified as estimates and flagged "J".

All missing data were requested but were not available.

All other calibration results, including efficiency checks and background counts, were acceptable.

12.4 ACCURACY

All spike recoveries should be within the specified QC range of 80 to 120 percent, while all radiometric yields should fall within the range of 30 to 105%. Spiked sample results outside

WHC-SD-EN-TI-211, Rev. 0

the above ranges resulted in qualification of the associated data as estimated and flagged "J/UJ".

Due to high chemical yields, carbon-14 results in sample numbers B08Y21, B08Y81, B08Y91, B08YC5 and B08YD0 in SDG No. B08Y11, sample numbers B08Y26, B08Y31, B08Y36, B08Y41, B08Y46, B08Y61, B08Y66, B08Y71, B08Y76, B08Y96, B08YCO and B08YF1 in SDG No. B08Y26 were rejected and flagged "R".

All other accuracy results were acceptable.

12.5 PRECISION

Analytical precision is expressed by the RPD between the recoveries of duplicate matrix spike analyses performed on a sample. When the laboratory has not performed duplicate spike analyses, precision may also be assessed using unspiked duplicate sample analyses. Replicates with a RPD less than 35 percent are acceptable. If duplicate activities for one or both are $<5 \times \text{LLD}$, a control limit of $2 \times \text{LLD}$ is used. If replicate values are both below the LLD, no control limit is applicable. If the RPD is outside the applicable control limit, associated results are qualified as estimated detects and flagged "J" or estimated non-detects and flagged "UJ".

All precision results were acceptable.

12.6 BLANK SAMPLES

Blank samples are analyzed to determine if positive results may be due to laboratory reagent, sample container, or detector contamination.

All blank results were acceptable.

12.7 ANALYTE QUANTITATION AND REPORTED DETECTION LIMITS

Analyte quantitation and detection limits were recalculated for all samples in each data delivery package to verify their accuracy.

All analyte quantitation and reported detection limits were acceptable.

12.8 OVERALL ASSESSMENT AND SUMMARY

A review of instrument performance and calibration indicates that the overall system performance is adequate. Due to high chemical yields the carbon-14 results in several samples were rejected. No daily check source was submitted for all carbon-14 results in two SDGs. All associated results were rejected and

WHC-SD-EN-TI-211, Rev. 0

flagged "R". Rejected data are unusable for all purposes and should not be reported. The daily check source was not identified for carbon-14 results in all SDGs. All associated results were qualified as estimates and flagged "J". Estimated data are considered usable for limited purposes only. All other QC data are considered to be acceptable and usable for all purposes.

WHC-SD-EN-TI-211, Rev. 0

13.0 TRITIUM DETERMINATION DATA VALIDATION**13.1 DATA PACKAGE COMPLETENESS**

The following data packages (SDG Nos.) were submitted for validation and found to be complete:

B08Y11 B08Y26 B08YB1 B08YB5

13.2 HOLDING TIMES

Holding times are calculated from Chain-of-Custody forms to determine the validity of the results. The maximum holding time for this analysis is six months.

All holding times were acceptable.

13.3 INSTRUMENT CALIBRATION AND PERFORMANCE

Instrument calibration is performed to establish that the low background liquid scintillation counting system used for tritium determination is capable of producing acceptable and reliable analytical data. The initial calibration was performed according to manufacturer's recommendations and consists of an instrument efficiency determination for each applicable radionuclide. Continuing calibration checks are performed to verify that instrument performance is stable and reproducible on a day-to-day basis.

No daily check source was submitted for all tritium results in SDG Nos. B08Y11 and B08Y26. All associated results were rejected and flagged "R".

The check source was not identified for tritium in SDG Nos. B08Y11, B08Y26, B08YB1 and B08YB5. All associated results were qualified as estimates and flagged "J".

All missing data were requested but were not available.

All other calibration results, including efficiency checks and background counts, were acceptable.

13.4 ACCURACY

All spike recoveries should be within the specified QC range of 80 to 120 percent, while all radiometric yields should fall

WHC-SD-EN-TI-211, Rev. 0

within the range of 30 to 105%. Spiked sample results outside the above ranges resulted in qualification of the associated data as estimated and flagged "J/UJ".

Due to matrix spike recoveries were grossly outside of the QC range, all tritium results for sample number B08YB1 in SDG No. B08YB1 and sample number B08YB5 in SDG No. B08YB5 were rejected and flagged "R".

Due to high yields, all tritium results in sample numbers B08Y31 and B08Y41 in SDG No. B08Y26 were qualified as estimates and flagged "J".

All other accuracy results were acceptable.

13.5 PRECISION

Analytical precision is expressed by the RPD between the recoveries of duplicate matrix spike analyses performed on a sample. When the laboratory has not performed duplicate spike analyses, precision may also be assessed using unspiked duplicate sample analyses. Replicates with a RPD less than 35 percent are acceptable. If duplicate activities for one or both are $<5 \times \text{LLD}$, a control limit of $2 \times \text{LLD}$ is used. If replicate values are both below the LLD, no control limit is applicable. If the RPD is outside the applicable control limit, associated results are qualified as estimated detects and flagged "J" or estimated non-detects and flagged "UJ".

All precision results were acceptable.

13.6 BLANK SAMPLES

Blank samples are analyzed to determine if positive results may be due to laboratory reagent, sample container, or detector contamination.

All blank results were acceptable.

13.7 ANALYTE QUANTITATION AND REPORTED DETECTION LIMITS

Analyte quantitation and detection limits were recalculated for all samples in each data delivery package to verify their accuracy.

All analyte quantitation and reported detection limits and sample results were acceptable.

WHC-SD-EN-TI-211, Rev. 0

13.6 OVERALL ASSESSMENT AND SUMMARY

A review of instrument performance and calibration indicates that the overall system performance is adequate. No daily check source was submitted for tritium results in two SDGs. All associated results were rejected and flagged "R". Due to poor matrix spike recoveries, tritium results in two SDGs were rejected and flagged "R". Rejected results are unusable for all purposes. The daily check source was not identified for tritium in all SDGs. All associated results were qualified as estimates and flagged "J". Due to high chemical yields, all tritium results for two samples in one SDG were qualified as estimates and flagged "J". Estimated data are considered usable for limited purposes only. All other QC data are considered to be acceptable and usable for all purposes.
