Environmental Regulatory Update

This report contains a bi-monthly update of environmental regulatory activity that is of interest to the Department of Energy. It is provided to DOE operations and contractor staff to assist and support environmental management programs by tracking regulatory developments. Any proposed regulation that raises significant issues for any DOE operation should be reported to the Office of Environmental Guidance (EH-23) as soon as possible so that the Department can make its concerns known to the appropriate regulatory agency. Items of particular interest to EH-23 are indicated by a shading of the RU#.

Any questions or comments about any aspects of the Update Table should be directed to Lois Thompson, Air, Water, and Radiation Protection Division, Office of Environmental Guidance, U.S. Department of Energy (EH-23), 202-586-9581.

ABSTRACT

The Environmental Regulatory Update Table provides information on regulatory initiatives of interest to DOE operations and contractor staff with environmental management responsibilities. The table is updated bi-monthly with information from the Federal Register and other sources, including direct contact with regulatory agencies. Each table entry provides a chronological record of the rulemaking process for that initiative with an abstract and a projection of further action.

Regulatory Highlights - July/August, 1994

1. Radiological Criteria for Decommissioning - Proposed Rule

The Nuclear Regulatory Commission (NRC) proposes to add a Subpart E to 10 CFR 20, Standards for Protection Against Radiation, to provide specific residual radiological criteria for the decommissioning of lands and structures at all NRC-licensed facilities. NRC defines decommissioning in the proposal as an action "to remove a facility or site safely from service and reduce residual radioactivity to a level that permits (1) release of the property for unrestricted use and termination of the license, or (2) release of the property under restricted conditions and termination of the license." Current regulations do not explicitly address radiological criteria for decommissioning. However, NRC presently allows decommissioning of nuclear facilities on a site-specific basis using existing guidance with emphasis on the concept that contamination levels (i.e. residual radioactivity) be as low as is reasonably achievable (ALARA). The Commission believes that inclusion of specific criteria in the regulations would result in more efficient and consistent licensing actions related to the numerous and complex site decommissioning activities anticipated in the future. The proposed criteria of 10 CFR 20.1404 for unrestricted release of a site following decommissioning would require that the residual radioactivity distinguishable from background radiation be no greater than 15 mrem/year Total Effective Dose Equivalent (TEDE) to an average member of the critical group, defined as "the group of individuals reasonably expected to receive the greatest exposure to residual radioactivity for any applicable set of circumstances." Residual radioactivity would also have to be reduced to levels that are ALARA. For licensees demonstrating that further reductions in residual radioactivity to comply with section 20.1404 "are not technically achievable, would be prohibitively expensive, or would result in net public or environmental harm," NRC proposes the use of institutional controls to provide reasonable assurance that the 15 mrem/year TEDE limit would not be exceeded. Although these standards would apply only to NRC-licensed facilities, the preamble mentions that the criteria are being developed in cooperation with EPA, which is concurrently developing standards for the cleanup of radioactively contaminated sites at non-NRC-licensed sites (ANPRM: 10-21-93, RU# 100-018.01) (e.g., those owned or operated by the Department of Energy). This cooperation between NRC and EPA is intended to ensure that effective and consistent site cleanup standards are established while minimizing duplicative efforts. Comments on the proposed rule will be accepted by NRC until December 20, 1994.

2. National Primary Drinking Water Regulations - Proposed Rules

Under the Safe Drinking Water Act (SDWA), EPA issues two proposed rules intended to address the Agency's concern regarding the balancing of public health risks from microbial contaminants in drinking water with those resulting from the use of disinfectants to kill such contaminants. The proposed rules, entitled the Disinfectants/Disinfection By-

products (D/DBP) rule and the Enhanced Surface Water Treatment (ESWT) rule, were developed through a regulatory negotiation process involving state and local health agency staff and elected officials, consumer groups, environmental groups, and representatives of public water systems. These rules, when finalized, will serve as interim measures until the Agency has more data on the health effects and occurrence of DBP and disease-causing organisms. [As part of this effort, on February 10, 1994, EPA proposed an information collection rule (ICR) that would require drinking water systems serving more than 10,000 persons to monitor for certain microbial contaminants and DBP for a limited time.]

The proposed D/DBP rule is an attempt to reduce the risks associated with disinfectants and their by-products in drinking water. This proposal would apply to all community water systems (i.e., systems serving residential populations) and all non-transient non-community water systems (e.g., systems serving work places and schools) that add a disinfectant during any part of the treatment process. To control the excessive use of disinfectants, EPA is proposing maximum residual disinfectant levels (MRDLs), analogous to enforceable maximum contaminant levels (MCLs), for chlorine and chloramines at 4.0 mg/l and for chlorine dioxide at 0.8 mg/l. The best available technology (BAT) for lowering the residual disinfectant concentrations in distribution systems includes control of treatment processes to reduce disinfectant demand. For organic and inorganic by-products of disinfection, the Agency is proposing MCLs and associated BATs, including a reduction of the MCL for total trihalomethanes from 0.10 mg/l to 0.080 mg/l. As with other drinking water regulations, the proposal contains monitoring and reporting requirements.

EPA realizes that the proposed D/DBP rule, with its provisions to reduce D/DBP concentrations, could undermine control of disease-causing organisms (i.e., pathogens) in water systems, especially those using a poor quality source water. The proposed ESWT rule seeks to address this concern. The proposal would apply to all public water systems that use surface water or ground water under the influence of surface water and that serve 10,000 or more people. However, all covered systems, regardless of size, would be required to perform a sanitary survey every five years. The proposal offers several alternative treatment requirements for augmenting the control of the waterborne pathogens *Giardia*, *Cryptosporidium*, and viruses. EPA's decision on which requirements are most appropriate will be influenced by monitoring data collected from the ICR, which the Agency intends to finalize by October 1994.

EPA will accept comments on the proposed D/DBP and ESWT rules until December 29, 1994, and May 30, 1996, respectively. The Agency intends to promulgate both rules by December 1996.

3. Oil Pollution Prevention: Non-Transportation-Related Onshore Facilities - Final Rule

EPA issues a final rule (NPRM: 2-17-93) amending the Oil Pollution Prevention regulations to incorporate the requirement under the Oil Pollution Act of 1990 which directs facility owners/operators to prepare response plans for the discharge of oil. The

scope of the final rule encompasses all owners/operators of non-transportation-related onshore facilities which are determined to be "substantial harm facilities." A substantial harm facility is determined based on risk-based factors specified in the rule (e.g., oil storage capacity, lack of secondary containment, type of transfer operation, proximity to fish and wildlife sensitive environments, spill history). This determination can be made by the owner/operator or the EPA Regional Administrator. If the Regional Administrator makes the determination, he or she must notify the facility owner/operator in writing of the determination. The final rule provides an appeal process to the EPA Administrator for review of the Regional Administrator's determination. For facilities for which the owner/operator makes the determination that the facility is not a "substantial harm facility," a signed certification form must be maintained on site documenting this determination. Response plans must address three scenarios: small, medium, and worst case discharges. Methods to calculate each scenario are specified in the rule for facilities and complexes (i.e., a facility with a combination of transportation related and non-transportation related activities). The response plan must also identify and ensure the availability of the necessary response personnel and equipment for the worst case discharge. Availability of resources must be ensured by "contract or other approved means," defined in the rule as including a written contract with an oil removal organization; written certification that the necessary personnel and equipment resources, owned and operated by the facility owner/operator are available; active membership in an oil spill removal organization; or other specific arrangements made by the Regional Administrator. The response plan must also include descriptions of training and drill exercises for facility oil spill response personnel. The response plans will be reviewed on a periodic basis not exceeding at least once every five years. Response plans must be revised and resubmitted to the Regional Administrator to reflect any planned or unplanned change in operations or regulatory requirements. This final rule was effective on August 30, 1994.

4. Operating Permits Program Rule Revisions - Proposed Rule

Under the Clean Air Act (CAA), EPA proposes revisions to regulations in 40 CFR part 70 concerning state air operating permit programs. The revisions mainly address when and how to obtain permits when an air emissions source has changed its operations. Other minor revisions and clarifications are also added to address issues which have been brought up during implementation of the Part 70 permitting process. Only those states submitting programs six months or later from date of publication of the final rule would have to comply with the revised Part 70 requirements. Permit changes under Part 70 can be grouped into three categories: off-permit changes (i.e., changes which can be made prior to revising the Part 70 permit), operational flexibility changes (i.e., changes which can be made without a permit revision), and changes which require a permit modification. The rule would clarify that off-permit changes must not violate a permit term or invoke any new applicable requirement, and must be incorporated in the permit within six months. The rule would alter the operational flexibility provisions of Part 70 by eliminating one operational flexibility alternative and revising the emission trading

provisions. The emission trading provisions would be revised to clarify that the state must allow emissions trading if the trading plan proposed by the source is consistent with all applicable requirements and meets the criteria established in this rule for responsible emissions trading. The rule would also clarify that trading terms and conditions must be included in the permit and subject to public review and comment.

The rule would also add a *de minimis* level in the permitting framework to establish four levels of permit revision. The *de minimis* level would apply to small units and certain small changes in big units. The source would be able to operate the change on the day the permit revision is submitted to the state, but the public and the state would have the opportunity to challenge the proposed change after the revision is submitted. The administrative amendment level of permitting would be amended to allow for construction of the change, before permit revision, based on preconstruction approval from the permitting authority. The minor permit modification would be amended to allow the public and EPA the opportunity to challenge the change before the source implements the change. In return, EPA is proposing to revise the permit shield provisions to cover all changes incorporated into the permit. EPA is also proposing to change the general permit provisions of Part 70 to provide for public notice of general permit approvals on a monthly basis and to allow judicial review of the permitting authority's decisions. EPA is also considering allowing the opportunity for the public to challenge the proposed change and allow permit shield protection as proposed for the minor permit modification.

Finally, the definition of "modifications under any provision of title I" would be clarified to include modifications governed by state or local agencies' new source review programs. The comment period for the proposed rule ends November 28, 1994.

IRIS DATABASE UPDATE

A DOE EH-231 Memorandum entitled *Integrated Risk Information System (IRIS) and Availability of Chemical Risk Assessment Guidance* was distributed in June 1991 to DOE Program Offices and Field Organizations. Attachment 1 to the memorandum, an ORNL-ESD report discussing access to and utilization of the *IRIS* online database, included "Table 1. *IRIS* Chemicals With Reference Doses and Carcinogen Assessments." The *IRIS* database has been updated extensively since that table was generated. The following table is the bimonthly updated version of Table 1 including all the chemicals listed in Table 1 along with additions/changes to the database planned through August 31, 1994. Additions/changes are those listed in the online *IRIS* database as accessed by our personnel through the National Library of Medicine. Changes in our table are shaded for ease of identification. Future issues of the *Environmental Regulatory Update Table* will include updates to the *IRIS* database during the previous two months. *Use only the most current version of the table.*

(Any questions or comments about how the chemical information for this *IRIS* Table is selected, downloaded and compiled should be addressed to Ms. Kim Slusher, Oak Ridge National Laboratory, (615) 576-1746).
