Coal Industry Annual 1993

December 1994

NOTICE

This is the first issue of the *Coal Industry Annual*. Because this is a new report, we encourage our subscribers to offer suggestions or comments for improving the usefulness of the report either through incorporating additional data or by eliminating some of the currently published data. Also, please let us know if you want these tables via the Energy Information Administration's Electronic Publishing System (EPUB) or other electronic means such as diskette. Please forward your comments and suggestions to Mary K. Paull, EI-522, Department of Energy, 1000 Independence Avenue, S.W., Washington, DC 20585 (telephone 202/254-5379; fax 202/254-6233).

This publication was prepared by Frederick L. Freme, Stephen Scott, and Thomas Murphy under the direction of Mary K. Paull, Team Leader, Coal Data Surveys, and Noel C. Balthasar, Chief, Coal and Uranium Data Systems Branch, Survey Management Division, Office of Coal, Nuclear, Electric and Alternate Fuels.

Specific information about the data in this report can be obtained from Frederick L. Freme (202/254-5367). All other questions on coal statistics should be directed to the National Energy Information Center (202/586-8800).

DISCLAIMER

This report was prepared as an account of work sponsored by an agency of the United States Government. Preface

Coal Industry Annual 1993 replaces the publication *Coal Production* (DOE/EIA-0125). See the Explanatory Notes for a mapping of tables from *Coal Production* to the *Coal Industry Annual*. This report presents additional tables and expanded versions of tables previously presented in *Coal Production*, including production, number of mines, productivity, employment, productive capacity, and recoverable reserves. This report also presents data on coal consumption, coal distribution, coal stocks, coal prices, coal quality, and emissions for a wide audience including the Congress, Federal and State agencies, the coal industry, and the general public. In addition, Appendix A contains a compilation of coal statistics for the major coal-producing States. This report does not include coal consumption data for nonutility power producers who are not in the manufacturing, agriculture, mining, construction, or commercial sectors. This consumption is estimated to be 5 million short tons in 1993.

The data presented in the report were collected and published by the Energy Information Administration (EIA), to fulfill its data collection and dissemination responsibilities, as specified in the Federal Energy Administration Act of 1974 (Public Law 93-275), as

amended. The Demonstrated Reserve Base (DRB) data that were previously presented in *Coal Production* are not presented in this report as these data are now reported in *U.S. Coal Reserves: An Update by Heat and Sulfur Content* (DOE/EIA-0529). This report does however present the recoverable portion of the DRB in Table 105.

This report constitutes the 18th annual report on coal production published by EIA and continues the series formerly included as a chapter in the *Minerals Yearbook* published by the Bureau of Mines.

The Office of Coal, Nuclear, Electric and Alternate Fuels gratefully acknowledges the cooperation of the respondents in supplying the information presented in this report and appreciates the valuable assistance of State coal mining agencies, the U.S. Department of the Interior: the Bureau of Land Management, the Minerals Management Service, the U.S. Department of Labor: the Mine Safety and Health Administration, the Bureau of Labor Statistics, The U.S. Department of Commerce: the Bureau of the Census, and the King Publishing Corporation.

A dragline digs into the seam of a large surface mine in the West.

Executive Summary

Coal's Role in the U.S. Energy Picture

Coal remained a dominant energy source in the United States in 1993, despite events that stemmed its growth. Total U.S. energy production declined in 1993 for the third consecutive year, down 2 percent to 66 quadrillion Btu. Most of the decline was attributed to lower coal production, which fell 1.1 quadrillion Btu from the 1992 level to 20.5 quadrillion Btu, and lower crude oil production, which fell 0.7 quadrillion Btu to 14.5 quadrillion Btu.

U.S. total energy consumption reached a record level of 84 quadrillion Btu in 1993, the second consecutive year of growth (Table ES1). The increase was primarily due to higher consumption of coal and natural gas. Consumption of coal in 1993 rose 4 percent to 926 million short tons, 20 quadrillion Btu. The growth occurred primarily at electric utilities where 88 percent of the coal was consumed. Coal's share of U.S. electricity generation in 1993 was 57 percent, slightly higher than in 1992 (Table ES2). Electric utilities used coal to meet the 4-percent increase in electricity demand and to make up for the loss of generation from nuclear-powered plants that were temporarily out of operation for maintenance.

For the second year in a row, coal exports declined, and, for the first time on record, coal was replaced by crude oil as the primary U.S. energy export. Coal exports dropped 27 percent from the 1993 level to 1.95 quadrillion Btu. U.S. coal imports reached a record level of 0.18 quadrillion Btu up 80 percent from the 1992 level. However, U.S. coal imports represented only about 1 percent of total U.S. energy imports (Table ES3 and Figure ES1). Table ES4 presents national summary level statistics on coal supply, distribution, demand, and prices for 1984 and 1989 through 1993.

Major Events Affecting the Coal Industry

The coal industry was heavily affected in 1993 by two events. The first event was the United Mine Workers of America (UMWA) strike against selected operations

of the Bituminous Coal Operators Association (BCOA). The second was the severe flooding along the upper Mississippi and Missouri River Basins.

UMWA Strike

The UMWA strike was the primary reason for the 52-million-short-ton drop in coal production. The first portion of the strike included 7,500 miners in four States who worked for Peabody Holding Company subsidiaries. It began on February 2, 1993, and ended on March 3, 1993, when both sides agreed to extend the 1988 contract for 60 days. This 1-month work stoppage did not affect consumer coal receipts substantially because deliveries continued from coal stockpiled at the mines prior to the start of the work stoppage, and spot market coal was available to make up any shortages.

On May 10, 1993, after unsuccessful negotiations, the UMWA began a "selective strike," targeting individual BCOA operations. The strike was expanded eight times before workers began returning to work on December 16, 1993. Five U.S. producers bore the brunt of the selective strike: the Peabody Holding Company, the Consolidation Coal Company, the Ziegler Coal Holding Company, the Arch Mineral Corporation, and Ashland Coal Inc.

During the main 7-month strike period from May to December 1993, these companies accounted for over 90 percent of the production loss due to the strike. The production loss by these companies ranged between 50 and 60 million short tons based on their 1992 mine level production figures. Other major companies affected by the strike, but to a lesser extent, included AMAX Coal, the Island Creek Coal Company, Keystone Coal Mining Corporation, and the Rochester and Pittsburgh Coal Company.

The EIA has estimated, based on 1992 company reported production for the struck mines, that the 1993 coal production lost by all companies that were struck amounted to approximately 70 million short tons. By State of origin, the approximate losses were 30 million short tons in West Virginia, 17 million short tons in Illinois, 8 million short tons in Kentucky, 6 million short tons in Indiana, 4 million short tons in Pennsylvania, 3 million short tons in Virginia, and 1 million short tons in Ohio. For a majority of the 7 month strike

¹ Includes lease condensate.

² Electric utility and industrial generation.

³ "Other" production is electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

⁴ Includes imports of crude oil for the Strategic Petroleum Reserve, which began in 1977.

⁵ Includes imports of unfinished oils and natural gas plant liquids.

⁶ "Other" imports are electricity and coal coke.

⁷ "Other" exports are natural gas, petroleum products, electricity and coal coke.

⁸ A balancing item. Includes stock changes, losses, gains, miscellaneous blending components, and unaccounted for supply.

⁹ Includes supplemental gaseous fuels.

¹⁰ Petroleum products supplied, including natural gas plant liquids and crude oil burned as fuel.

¹¹ Electric utility and industrial generation, and net imports of electricity.

¹² "Other" consumption is net imports of coal coke and electricity generated for distribution from wood, waste, geothermal, wind photovoltaic, and solar thermal energy.

* Data round to zero.

^P Preliminary data.

Notes: Due to lack of consistent historical data, some renewable energy sources are not included. For 1991 consumption, 3.3 quadrillion Btu of renewable energy consumed by U.S. electric utilities to generate electricity for distribution is included, but an estimated 3.4 quadrillion Btu of renewable energy used by other sectors in the United States is not included. Total may not equal sum of components due to independent rounding.

period, nearly 17,000 miners were out of work at approximately 100 mining operations. During the strike, some of the lost production was made up for by increased production by other companies and increased coal purchases by the affected companies.

As the prospects for a settlement diminished, the Secretary of Labor appointed a Federal mediator, which eventually resulted in the ratification of a new 5-year contract in December 1993. Terms of the contract included increases in wages and pensions, and agreement that 60 percent of new job openings would be filled by laid-off and active UMWA miners. The companies, in turn, won the right to establish more flexible work rules and scheduling of miners. Some health care benefits were expanded; however, a new health care system was established that was designed to reduce costs. This 7-month strike had a substantial impact on consumer coal receipts, stocks, and prices, particularly at electric utility plants.

Severe Flooding

Severe flooding along the upper Mississippi River and Missouri River Basins from June through August disrupted the delivery of coal to consumers, primarily electric utilities. States affected by the flooding included Iowa, Illinois, Minnesota, Missouri, North Dakota, South Dakota, Wisconsin, Nebraska, and Kansas. However, electric utility plants beyond this area were also affected. Unit coal trains from the Powder River Basin pass through these States on their way to power plants located in the South and the East. Trains were delayed or rerouted around the flooded region. As late as November, some coal train cycle times from the Powder River Basin, Utah, and Colorado were running as much as 30 percent longer than normal.

In addition to the flooding, the demand for western coal increased because electric utilities tried to replace coal lost due to the coal strike, to rebuild coal stocks, and to switch to low-sulfur coal before the January 1, 1995, deadline set by the Clean Air Act Amendments of 1990.

Some power plants in the flooded region did not receive any coal by train or barge from late June until the waters receded in late August. Fuel-switching from coal to gas occurred at some power plants in order to conserve coal supplies and was necessary at other power plants because coal stocks were wet and coal-handling equipment could not be operated. In addition, some electric utilities purchased power from electric utilities unaffected by the flood.

Supply

Production

U.S. coal production in 1993 totaled 945 million short tons, 52 million short tons less than in 1992, resulting in a corresponding decline in capacity utilization at mines from 80 percent in 1992 to 75 percent in 1993. The strike was one of the primary causes of the declines; however, another significant factor was a 27-percent drop in coal exports. Wyoming was the leading coal-producing State followed by Kentucky and West Virginia.

The UMWA strike primarily affected coal production east of the Mississippi River. Since domestic consumption was strong, particularly in the electric utility sector, consumers and producers/distributors drew down stocks to meet the demand, 43 million short tons and 9 million short tons, respectively. At the end of 1993, producer and distributor stocks totaled 25 million short tons, the lowest end-of-year level since 1981. In addition, coal imports, which were almost twice the 1992 level, filled some of the increase in demand.

Compared with 1992, all States east of the Mississippi River, with the exception of Maryland, produced less coal in 1993, led by West Virginia, Illinois, and Pennsylvania, which produced 32 million short tons, 19 million short tons, and 9 million short tons less coal, respectively. There was a net loss of 265 mines and 8,249 miners in States east of the Mississippi River. Miner productivity in this region, which for the last few years had a gain of from 4 to 7 percent, only went up 1 percent to 3.11 short tons per miner per hour.

Coal production west of the Mississippi River in 1993 rose by 20 million short tons from 1992, primarily due to a 20-million-short ton increase in Wyoming coal output. The number of mines in this region declined by 6 and the number of miners declined by 625, while coal miner productivity rose 10 percent to 12.14 short tons per miner per hour.

Coal Mine Prices

The average mine price of U.S. coal in 1993 was \$19.85 per short ton, down 6 percent (8 percent in real terms) from the 1992 level of \$21.03 per short ton. The largest decrease in coal prices occurred at mines west of the Mississippi River, 4 percent (6 percent in real terms), while coal prices at mines east of the Mississippi River dropped 2 percent (4 percent in real terms).

Coal Imports

U.S. coal imports reached 7.3 million short tons in 1993, a record level and 92 percent more than in 1992. Most of the increase in coal imports was due to higher shipments to electric utilities from Colombia, Venezuela, and Indonesia and to coke plants from Canada.

Imported coal prices in 1993 dropped 11 percent to \$29.89 per short ton. The price of coal imports from South America dropped while those from Indonesia and Canada increased. Coal imports in 1993 were valued at \$218 million.

Demand

Coal Consumption

In 1993, domestic coal consumption reached a record level of 926 million short tons, nearly 4 percent higher than in 1992. The increase was primarily due to the 4.3 percent increase in electric utility consumption, which resulted from an increase in electricity demand. The hot summer of 1993 combined with the relatively cool summer of 1992, resulted in a 6-percent increase in residential electricity demand. Electricity demand was also spurred by economic growth. A decrease in U.S. net electricity imports from Canada also boosted electric utility coal consumption as domestic coal-fired generation replaced imported Canadian electricity.

The growth in electric utility coal consumption was concentrated in the Midwest and Southeast, where sev-

eral nuclear plant outages occurred during the year. Coal use increased in all States within the East North Central Census Division, where the increase in electric utility coal consumption was particularly high in Illinois. Illinois and other States in the region turned to Wyoming and other western States for more of their coal supplies.

Coal consumption at industrial plants, except coke plants, totaled 75 million short tons, up slightly from the 1992 level. Most of the gain took place in the West South Central Census Division, primarily in Oklahoma and Texas. Coal consumption at manufacturing plants rose 2 percent primarily in the stone, clay, and glass industries

Coal consumption at coke plants in 1993 declined 3 percent to 31 million short tons, primarily because consumption at coke plants in Ohio and Indiana dropped. Although U.S. pig iron production rose slightly in 1993, part of the increased demand for coke was met by drawdowns in coke inventories, rather than by increasing coke production.

Residential and commercial coal consumption in 1993 rose slightly. Most of the gain took place in the South Atlantic, Pacific, and West North Central Census Divisions, which was offset by a large decline in the Middle Atlantic Census Division, particularly in Pennsylvania.

The average sulfur content (measured as percent sulfur by weight) of coal received at electric utilities in 1993 was 1.18 percent, down from 1.29 percent in 1992. The quality of coal received at manufacturing and coke plants in 1993, however, showed an increase in the sulfur content.

Figure ES1. Trends in U.S. Coal Production, Imports, Consumption, Exports, and Stocks, 1984-1993

Sources: • Production: Energy Information Administration (EIA), Form EIA-7A, "Coal Production;" U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Coal Production Report;" and State Mining Agency Coal Production Reports. • Imports: U.S. Department of Commerce, Bureau of the Census, "Monthly Report IM 145." • Producer and Distributor Stocks: EIA, Form EIA-6, "Coal Distribution Report." • Exports: U.S. Department of Commerce, Bureau of the Census, "Monthly Report EM 545." • Consumption and Consumer Stocks: EIA, Form EIA-759, "Monthly Power Plant Report;" Form EIA-3, "Quarterly Coal Consumption Report - Manufacturing Plants;" Form EIA-5, "Coke Plant Report - Quarterly;" and Form EIA-6, "Coal Distribution Report."

Coal Stocks

Since 1984 there has been a downward trend in the level of coal stocks held by coal consumers, particularly electric utilities. With abundant coal supplies and falling coal prices, many utilities decided to reduce costs by adjusting their stockpiles to the lowest prudent level.

In 1993, the UMWA strike caused consumer coal stocks to reach record low levels. Because of the drop in production that resulted from the strike, electric utilities in particular drew down their stockpiles to help meet the increase in demand.

U.S. consumer coal stocks on December 31, 1993, totaled 120 million short tons, 43 million short tons less than at the end of 1992. Almost all of the decrease was due to a 28-percent drop in coal stocks at electric utilities. Year-end electric utility coal stocks equaled 111 million short tons, the lowest end-of-year level since 1974. Coal stocks at coke plants and other industrial plants also declined by 8 percent and 4 percent, respectively.

Delivered Coal Prices

The price of coal delivered to all domestic consuming sectors declined in 1993. The delivered price of coal to electric utilities declined by 3 percent (5 percent in real terms) to \$28.58 per short ton; to industrial plants by 2 percent (4 percent in real terms) to \$32.23; and to coke plants by 1 percent (3 percent in real terms) to \$47.44.

Coal Exports

U.S. coal exports in 1993 totaled 75 million short tons, a 27-percent decrease from 1992 and the lowest level since 1979. The primary reasons for the decline were a severe recession in Europe; continuing pressures to protect European coal producers from import competition; and greater inroads into European and Asian markets by other major coal-producing countries. Some major U.S. coal exporters were also affected by the coal miners' strike.

Most of the decline in U.S. coal exports was due to a 55-percent fall in steam coal exports to Europe and a 59-percent drop in steam coal exports to Canada. Total U.S. steam coal exports fell by 42 percent. Steam coal accounted for 33 percent of total U.S. coal exports in

1993, down from 42 percent in 1992. However, U.S. steam coal exports to Asia, particularly Japan, increased.

U.S. metallurgical coal exports in 1993 amounted to 50 million short tons, a decrease of 16 percent from 1992, due to a 20-percent decline in exports to Europe. There were no substantial gains of metallurgical coal exports, in tonnage terms, to any of the importing countries.

West Virginia was the major coal-exporting State, shipping 33 million short tons, down 35 percent from 1992 shipments. This level represented 44 percent of total foreign shipments and the lowest level of foreign shipments for the State since 1989. Shipments of West Virginia metallurgical coal declined 8 million short tons, while shipments of steam coal declined 10 million short tons.

The average price of U.S. coal exports in 1993 was \$41.41 per short ton, slightly higher than in 1992, but 2 percent lower in real dollars. Metallurgical coal export prices declined 3 percent (5 percent in real terms) to \$44.11 per short ton, while steam coal export prices went up 1 percent (2 percent in real terms) to \$36.03 per short ton. Coal exports in 1993 were valued at \$3 billion.

Company Mergers and Sales

The Cyprus Minerals Company and Amax Incorporated merged on November 12, 1993. The new company, Cyprus AMAX Minerals Company, will have annual sales of \$2.8 billion and assets of \$5 billion, including coal reserves totaling 3 billion short tons worldwide. The company's U.S. coal mining operations produced 65 million short tons of coal in 1993.

The Occidental Petroleum Corporation sold its coal subsidiary, Island Creek Coal Company, to Consol Energy Inc., in July 1993. Island Creek operations include mines in Kentucky, Virginia, and West Virginia. The addition of Island Creek brought Consol Energy's 1993 production total to 51 million short tons and made Consol the third largest U.S. coal producer in 1993 behind Peabody and Cyprus AMAX. Peabody remained the largest producer with 70 million short tons despite a significant production drop caused by the UMWA strike. Consol's production was also seriously affected by the UMWA strike.

¹ For 1984, the Form EIA-7A solicited data on "Daily Productive Capacity." To obtain annual productive capacity for a mine in 1984, each mine's daily productive capacity was multiplied by the number of days worked during the year.

² Capacity utilization (percent) is the ratio of total production to annual productive capacity as reported by mining companies on Form EIA-7A. Productivity (short tons per miner per hour) is calculated by dividing total coal production by the total direct labor hours worked by all employees engaged in production, preparation, processing, development, maintenance, repair, and shop or yard work at mining operations.

³ Imports for 1992 and 1993 include imports to electric utilities, manufacturing plants and coke plants. Imports for 1984 through 1991 include only imports to electric utilities.

⁴ Includes Mexico.

* Data round to zero.

NA Not available.

Notes: Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Totals may not equal sum of components due to independent rounding.

Supply

Production

U.S. coal production in 1993 dropped to its lowest level since 1987, 52 million short tons less than in 1992 (Table 1). Coal production in the Appalachian and Interior coal-producing regions fell 47 million short tons and 28 million short tons, respectively, but production in the Western Region rose by 23 million short tons.

Most of the production decline occurred in Appalachia, which bore the brunt of both the United Mine Workers of America (UMWA) strike and the decline in coal exports. West Virginia and Pennsylvania were the most severely affected with production drops of 20 percent and 13 percent, respectively.

In the Interior Region most of the loss occurred in Illinois, where coal production fell 31 percent, and in western Kentucky, where coal production dropped 13 percent. The 77-percent drop in Missouri coal production was due to the closing of the largest mine in the State.

Coal production in the Western Region in 1993 rose 7 percent above the 1992 level to 369 million short tons. Wyoming accounted for 86 percent of this increase, although there were also production gains in New Mexico and Colorado. Wyoming coal production in 1993 reached 210 million short tons, a new record, and about 22 percent of the U.S. total. Campbell County in Wyoming accounted for 86 percent of the State's coal output (Table 4). The increase in Wyoming coal production was due to higher demand for low-sulfur coal from the Powder River Basin. Much of the additional coal output from Wyoming was shipped to electric utilities in the Midwest, particularly in Illinois displacing indigenous high-sulfur coal, and to Texas. The additional coal produced in New Mexico mines was shipped to power plants in Arizona and Wisconsin. Colorado's coal production increased in response to a general increase in demand.

As a result of the regional changes in coal production in 1993, the Western Region's share of U.S. coal output rose from 35 percent in 1992 to 39 percent in 1993. Appalachia's share of production fell to 43 percent from 46 percent in 1992 and the Interior's share fell to 18 percent from 20 percent in 1992. In 1984 Appalachia's share of total U.S. coal production was 50 percent and the Western Region's share was 28 percent. Over 30 percent of coal output (reported as sales volume) in 1993 came from Federal and Indian lands (Table 12).

The number of U.S. coal mines in 1993 dropped 10 percent from the 1992 level to 2,475 mines (Table 2). The most notable drops were in West Virginia, where the number of mines declined by 102 and in eastern Kentucky, where the number of mines declined by 62. The number of mines in the Western Region fell by 4, while in the Interior Region the number of mines increased by 5 to 219 mines.

Of the 351 million short tons of coal produced in underground mines, 56 percent was mined by continuous mining and 31 percent by longwall mining (Table 5). About two-thirds of the U.S. coal produced in 1993 came from mines producing 1 million short tons or more (Table 6). Bituminous coal accounted for 61 percent of the total coal produced, followed by subbituminous at 29 percent, lignite at 9 percent, and anthracite at less than 1 percent (Table 9). Union mines provided about one-third of the total production, 315 million short tons, and the UMWA mines accounted for nearly three-fourths of the union production (Table 11). Although coal production in 1993 was 5 percent less than in 1991, the share of production by foreign-controlled firms increased by 9 percent (Figure 2).

Productive Capacity

Productive capacity at U.S. coal mines in 1993 was 1.3 billion short tons, 2 percent higher than 1992 (Table 15). As a result, capacity utilization (the ratio of total production to productive capacity) of mines in all regions declined, most notably in Appalachia and the Interior, as a result of the UMWA strike (Table 16). The capacity utilization of mines in Appalachia dropped to 73 percent from 81 percent in 1992, and in the Interior to 74 percent from 83 percent in 1992.

Recoverable Coal Reserves

Recoverable coal reserves at active mines in 1993 totaled 22 billion short tons; 15 billion short tons at surface mines and 7 billion short tons at underground mines. The average coal recovery percentage in 1993 was 79 percent -- 89 percent at surface mines and 56 percent at underground mines. Almost two-thirds of the recoverable coal reserves are located West of the Mississippi River and 93 percent of these reserves are at surface mines, which have an average recovery percentage of 91 percent. Recoverable coal reserves at union mines amounted to 9 billion short tons, 40 percent of the total.

Producers and Distributors Stocks

Due to the increased demand and shortages resulting from the UMWA strike, U.S. producers and distributors drew down coal stocks by 26 percent to 25 million

short tons, the lowest year-end-level since 1981 (Table 33).

Coal Imports

U.S. coal imports reached 7.3 million short tons in 1993 (Table 34), nearly double the 1992 level. Most of the increase was due to increased electric utility demand for coal from Colombia and Venezuela. Some utilities also took the opportunity to use imported coal for test burns. In addition, industrial plants increased their coal imports 420 percent above the 1992 level, reaching nearly 1 million short tons (Table 38). Most of the increase was due to higher shipments from Canada to coke plants in Indiana.

Production

Overburden is removed prior to strip mining at the Big John mine in Kentucky.

West of Miss. River	12,342	1,049	24,264	-	-	-	37,654
U.S. Total	198,305	41,542	109,653	252	1,300	2	351,053

¹ Calculated by multiplying reported mining method percentages by the individual mine production.

² Includes scoop loading and hand loading.

³ Calculated by subtracting the sum of the reported mining methods from total underground production.

⁴ For a definition of coal-producing regions, see Appendix C.

Note: Totals may not equal sum of components due to independent rounding.

Source: Energy Information Administration, Form EIA-7A, "Coal Production Report."

U.S. Total	351,053	594,371	945,424	260	7	1,346

¹ The coalbed ID number is a unique code assigned by EIA to each correlated coalbed or to coal-bearing geologic formations, coal groups, or coal zones.

² The coalbed name given is the name most commonly used in the State having the greatest production from that coalbed. The States having the greatest production for each coalbed are: Eastern Kentucky (coalbeds 0111, 0135, 0151, 0154, 0157, 0168); West Virginia (0036, 0084, 0103, 0344); Pennsylvania (0071); Western Kentucky (0489); Indiana (0483); Illinois (0484); North Dakota (1569); Montana (1808); Wyoming (1699). In some other States where these are major producing beds, the following alternate coalbed names are also used: 0084, No. 5 Block (Eastern Kentucky); 0111, Coalburg (West Virginia); 0135, Chilton (West Virginia); 0151, Jellico (Tennessee); Taggart (Virginia); Cedar Grove (West Virginia); 0154, Lower Cedar Grove (West Virginia); 0157, Upper Standiford (Virginia); Alma (West Virginia); 0168, No. 2 Gas (West Virginia); 0483, No. 12 (Western Kentucky); 0484, No. 11 (Western Kentucky); 0489, No. 5 (Illinois and Indiana).

³ Average thickness is the bed thickness weighted by bed production.

⁴ Includes mines with production of less than 10,000 short tons, which are required to provide only production data.

NA Not available.

Notes: Coal production excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. A major coalbed is defined here as a coalbed from which 10 million short tons of coal were produced during the year. The category "Other Coalbeds" includes all coalbeds from which less than 10 million short tons were produced during the year. In some regions coalbeds are characteristically discontinuous or uncorrelatable from one location to another, and production is identified by the geological formations, coal groups, or coal zones of the native rock where the coalbeds occur. These types of coalbeds are found primarily in the Rocky Mountain States and in the Gulf Coast lignite belt. Coalbeds of these types are included in "Other Coalbeds," even though production may exceed 10 million short tons, because numerous separate coalbeds contribute to the totals. Totals may not equal sum of components due to independent rounding.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report;" State Mining Agency Coal Production Reports; and/or U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Coal Production Report."

U.S. Total		945,424	100.0

Notes: Major coal producers are companies that produced more than 2 million short tons in 1993. The company is the firm owning the mineral rights to the mined coal.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report;" State Mining Agency Coal Production Reports; and/or U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Production Report."

Figure 2. Production by Foreign-Controlled Firms as a Percentage of Total U.S. Coal Production, 1976, 1986, 1991, 1993

Note: Foreign-controlled firms are U.S. coal producers with more than 50 percent of their stock or assets owned by a foreign firm.

Sources: • 1976, 1986, 1991: Energy Information Administration (EIA), "The Changing Structure of the U.S. Coal Industry: An Update."

• 1993: (EIA), Form EIA-7A, "Coal Production Report."

Productive Capacity

A dragline operator carefully maneuvers a bucket from the open face of this strip mine. Sixty-one percent of productive capacity 1993 came from surface mines.

¹ For 1984, the Form EIA-7A solicited data on "Daily Productive Capacity." To obtain annual productive capacity for a mine in 1984, each mine's daily productive capacity was multiplied by the number of days worked during the year.

² For a definition of coal-producing regions, see Appendix C.

w Withheld to avoid disclosure of individual company data.

NA Not available.

Notes: Productive capacity is the maximum amount of coal that can be produced annually as reported by mining companies on Form EIA-7A. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons, which are not required to provide these data. Totals may not equal sum of components due to independent rounding.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report."

¹ Calculated by multiplying reported mining method percentages by the individual mine capacity.

² Includes shortwall, scoop loading, hand loading and unknown.

³ For a definition of coal-producing regions, see Appendix C.

w Withheld to avoid disclosure of individual company data.

Notes: Productive capacity is the maximum amount of coal that can be produced annually as reported by mining companies on Form EIA-7A. Capacity utilization is the ratio of total production to annual productive capacity as reported by mining companies on Form EIA-7A. Excludes mines producing less than 10,000 short tons, which are not required to provide these data. Totals may not equal sum of components due to independent rounding.

¹ For a definition of coal-producing regions, see Appendix C.

w Withheld to avoid disclosure of individual company data.

Notes: Productivity is calculated by dividing total coal production by the total direct labor hours worked by all employees engaged in production, preparation, processing, development, maintenance, repair, and shop or yard work at mining operations. Excludes office workers. Includes mining operations management and all technical and engineering personnel. Productive capacity is the maximum amount of coal that can be produced annually as reported by mining companies on Form EIA-7A. Capacity utilization is the ratio of total production to annual productive capacity as reported by mining companies on Form EIA-7A. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons and preparation plants with less than 5,000 employee hours, which are not required to provide these data. Totals may not equal sum of components due to independent rounding.

¹ For a definition of coal-producing regions, see Appendix C.

w Withheld to avoid disclosure of individual company data.

Notes: Recoverable reserves represent the quantity of coal that can be recovered (i.e., mined) from existing coal reserves at reporting mines. Productive capacity is the maximum amount of coal that can be produced annually as reported by mining companies on Form EIA-7A. Capacity utilization is the ratio of total production to productive capacity as reported by mining companies on Form EIA-7A. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons, which are not required to provide these data. Totals may not equal sum of components due to independent rounding.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report;" State Mining Agency Coal Production Reports; and/or U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Coal Production Report."

w Withheld to avoid disclosure of individual company data.

Notes: Productive capacity is the maximum amount of coal that can be produced annually as reported by mining companies on Form EIA-7A. Capacity utilization is the ratio of total production to annual productive capacity, as reported by mining companies on Form EIA-7A. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons, which are not required to provide these data. Totals may not equal sum of components due to independent rounding. See Glossary for listing of other unions.

Source: Energy Information Administration, Form EIA-7A, "Coal Production Report."

Recoverable Coal Reserves at Mines

Operations at the Antelope surface mine in Converse County, Wyoming. After the coal is removed, the front-end loader fills the in-pit crusher and an overland conveyor system transports the coal from the mine to the storage facilities.

Figure 3. Recoverable Coal Reserves at U.S. Coal Mines by Mine Type and by Region, 1984-1993

w Withheld to avoid disclosure of individual company data.

Notes: Average recovery percentage represents the percentage of coal that can be recovered from coal reserves at reporting mines, weighted for all mines in the geographic area. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons, which are not required to provide these data.

¹ For a definition of coal-producing regions, see Appendix C.

* Data round to zero.

w Withheld to avoid disclosure of individual company data.

Notes: Recoverable reserves represent the quantity of coal that can be recovered (i.e., mined) from existing coal reserves at reporting mines. Average recovery percentage represents the percentage of coal that can be recovered from coal reserves at reporting mines, weighted for all mines in the reported geographic area. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons, which are not required to provide these data. Totals may not equal sum of components due to independent rounding. See Glossary for listing of other unions.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report;" State Mining Agency Coal Production Reports; and/or U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Coal Production Report."

Table 32. Status of Recoverable Coal Reserves and Coal Production from Producing Federal Coal Leases by State, Fiscal Year 1993
(Million Short Tons)

Coal-Producing State	Number of Leases	Recoverable Coal Reserves	Production
Alabama	2	30	0.4
Alaska	-	20	-
Colorado	28	1,560	13.2
Kentucky	1	10	.1
Montana	13	970	26.6
New Mexico	8	280	4.0
North Dakota	5	150	2.9
Oklahoma	3	50	.5
Utah	35	3,060	19.0
Washington	1	-	.8
Wyoming	35	6,880	178.5
U.S. Total	131	13,010	246.0

Note: Fiscal year 1993 is the period from July 1, 1992 to June 30, 1993. Output from Federal Lands is reported as sales volume, the basis for royalties. It is approximately equivalent to production, which includes coal sold and coal added to stockpiles. Totals may not equal sum of components because of independent rounding.

Source: U.S. Department of the Interior, Bureau of Land Management, *Federal Coal Management Report for Fiscal Year 1993, Production and Royalties of Federal Coal Leases*.

Producer/Distributor Stocks

U.S. producer and distributor stocks at the end of 1993 totaled 25 million short tons, the lowest year-end level since 1981.

Table 33. Year-End Producer and Distributor Coal Stocks by State, 1989-1993

Imports

Coal from overseas is off-loaded by a traveling shiploader at the dock of Electro-Coal Transfer's Davat, Louisiana facilities.

Employment and Productivity

Employment

In 1993, the average number of miners working daily at mines and/or preparation plants producing or processing 10 thousand or more short tons of coal, dropped 8 percent from the 1992 level (Table 39), to 101 thousand miners. Employment declined in all States except Alabama, Colorado, Louisiana, Maryland, New Mexico, and North Dakota. All three coal-producing regions experienced a decline in employment, the largest occurring in Appalachia which had a 9 percent decline, and in the Interior Region which had an 8 percent drop. In both of these regions, 1993 employment was affected by the coal strike.

The average number of miners at underground mines in 1993 totaled 65 thousand miners and represented 64 percent of all U.S. miners (Table 40). Employment at underground mines declined 9 percent from the 1992 total. Most of the decline occurred in Appalachia which experienced a 10-percent drop in employment.

In 1993, the average number of miners at surface mines dropped by 7 percent from the 1992 level to 37 thousand miners (Table 41). Less employment in the Appalachian and the Interior Regions accounted for most of the decline in surface miners.

Forty (40) percent of the miners worked in the 196 mines that produced 1 million short tons or more in 1993, and those miners accounted for 67 percent of total production (Table 42). In 1993, 46 thousand miners, or 45 percent of the U.S. total belonged to a union. Ninety one (91) percent of the union workers were affiliated with the United Mine Workers of America (UMWA) (Table 45).

U.S. coal mine nonfatal, disabling injuries in 1993 totaled 10,364, a 3-percent drop from the 1992 level. Of those injuries, 47 were fatal, 13 percent less than in 1992 (Table 46). Since 1989, fatal injuries have dropped at an average annual rate of 10 percent.

Productivity

In 1993, productivity at U.S. coal mines producing 10 thousand or more short tons of coal increased 8 percent to 4.7 short tons per miner hour from 4.4 short tons per miner hour in 1992 (Table 48). Regionally, most of the increase occurred in States west of the Mississippi River. Over the last decade (1984-1993), productivity at U.S. coal mines has increased at an average annual rate of almost 7 percent, due to an average annual productivity gain of between 6 and 7 percent at both U.S. underground and surface mines (Tables 49 and 50). During the past 5 years, the average annual productivity gain at underground mines has slowed somewhat. Over the same period, the growth rate at surface mines has stayed at nearly 7 percent. In 1993 surface mining productivity rose 10 percent from 6.6 tons per hour to 7.2 tons per hour.

Tables 54 through 57 present new data on productivity by mining method, seam thickness, mine production range, and union type. Because the 1993 selective coal strike by the UMWA negatively affected some of the more productive unionized mines, UMWA productivity figures for 1993, as reported in Table 57, should not be considered as representing a level playing field comparison of union versus nonunion productivity.

Employment

Roof supports shield a miner as he operates a longwall machine at an underground mine in Illinois.

Figure 6. Average Number of U.S. Miners by Mine Type and by Region, 1984-1993

Figure 7. U.S. Coal Mining Productivity by Mine Type and by Region, 1984-1993

Note: Scale has been enlarged to show detail in the short tons per miner per hour by type of mining plot. Because vertical scales differ, graphs should not be compared. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons of coal during the year and preparation plants with less than 5,000 employee hours. Includes all employees engaged in production, preparation, processing, development, maintenance, repair, shop or yard work at mining operations. Excludes office workers. Includes mining operations management and all technical and engineering personnel. Short tons produced per miner per hour is calculated by dividing total coal production by the direct labor hours worked by all mine employees.

¹ For a definition of coal-producing regions, see Appendix C.

Notes: Includes all employees engaged in production, preparation, processing, development, maintenance, repair, shop or yard work at mining operations. Excludes office workers. Includes mining operations management and all technical and engineering personnel. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons and preparation plants with less than 5,000 employee hours, which are not required to provide these data.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report;" State Mining Agency Coal Production Reports; and/or U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Coal Production Report."

¹ Includes all employees at preparation plants and tipples not co-located with a mine.

² For a definition of coal-producing regions, see Appendix C.

Notes: Includes all employees engaged in production, preparation, processing, development, maintenance, repair, shop or yard work at mining operations. Excludes office workers. Includes mining operations management and all technical and engineering personnel. Excludes silt, culm refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons and preparation plants with less than 5,000 employee hours, which are not required to provide these data.

Productivity

Continuous mining machines such as this one contribute to increased productivity of underground coal mining. This method accounted for 56 percent of U.S. underground coal mining in 1993.

¹ For a definition of coal-producing regions, see Appendix C.

Notes: Productivity is calculated by dividing total coal production by the total direct labor hours worked by all mine employees. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons, which are not required to provide these data.

¹ Mining operations that consist of a mine and preparation plant, or a preparation plant only processing both underground and surface coal will be counted as two operations.

² Includes all employees engaged in production, preparation, processing, development, maintenance, repair, shop or yard work at mining operations. Excludes office workers. Includes mining operations management and all technical and engineering employees.

³ Calculated by dividing total coal production by the total direct labor hours worked by all mine employees.

⁴ Calculated by multiplying average production per miner per hour by the average length of a miner shift.

⁵ For a definition of coal-producing regions, see Appendix C.

Notes: Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania Anthracite. Excludes mines producing less than 10,000 short tons of coal during the year, and preparation plants with less than 5,000 employee hours, which are not required to provide these data.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report;" State Mining Agency Coal Production Reports; and/or U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Coal Production Report."

¹ For a definition of coal-producing regions, see Appendix C.

* Data round to zero.

Notes: Weighted average number of days worked is calculated by multiplying average days worked for each mine times its production and then summing these products over all mines in the region/state and then dividing the sum by the total production for the region/state. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons, which are not required to provide these data.

U.S. Total	2.84	2.56	3.30	2.74	2.95

¹ Mines that produce greater than 50 percent of coal by continuous mining method.

² Mines that produce greater than 50 percent of coal by conventional mining method.

³ Mines that have any production from longwall mining method. A typical longwall mining operation uses 80 percent longwall mining and 20 percent continuous mining.

⁴ Mines that produce coal using shortwall, scoop loading, hand loading, or other mining methods or a 50/50 percent continuous/conventional split in mining method.

⁵ For a definition of coal producing regions, see Appendix C.

Notes: For each State, stand alone preparation plant hours are distributed across the mining methods by the proportion of production for all stand alone mines. Productivity is calculated by dividing total coal production by the total direct labor hours worked by all mine employees. Excludes mines producing less than 10,000 short tons of coal during the year, and preparation plants with less than 5,000 employee hours, which are not required to provide these data.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report;" State Mining Agency Coal Production Reports; and/or U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Coal Production Report."

> 120	5.24	3.00	5.62	-	-	-	14.86	14.06
U.S. Total	3.20	2.93	3.47	1.74	2.15	-	7.23	4.70

¹ Calculated by multiplying reported mining method percentages by the individual mine production.

² Includes scoop loading and hand loading.

³ Calculated by subtracting the sum of the reported mining methods from total received underground productivity.

Notes: Productivity is calculated by dividing total coal production by the total direct labor hours worked by all mine employees. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons, which are not required to provide these data.

¹ For a definition of coal-producing regions, see Appendix C.

Notes: Productivity is calculated by dividing total coal production by the total direct labor hours worked by all mine employees. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons, which are not required to provide these data. See Glossary for listing of other unions.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report;" State Mining Agency Coal Production Reports; and/or U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Coal Production Report."

Distribution

Coal distribution during 1993 totaled 959 million short tons, 4 percent less than in 1992 (Table 58). Coal distributed from Wyoming, the Nation's leading coal producer, totaled 212 million short tons and represented 22 percent of the total. Collectively, coal distribution from the three major coal-producing States, Wyoming, Kentucky, and West Virginia, totaled 508 million short tons, or 53 percent of total U.S. distribution.

Texas was the leading destination for coal distributed domestically during 1993, with shipments totaling 95 million short tons or 10 percent of total distribution (Table 65). Of the coal distributed to Texas, 57 percent was indigenous, with virtually all of the balance arriving from Wyoming and Colorado.

Other major destination States included Ohio, Indiana, and Pennsylvania, which collectively accounted for 163 million short tons, or 17 percent of total 1993 distribution. As with Texas, a significant portion of the coal distributed in these States was indigenous (Appendix A).

Foreign distribution of U.S. coal during 1993 totaled 76 million short tons, representing 8 percent of the total amount of coal distributed (Table 65). The leading source of U.S. coal exports in 1993 was West Virginia, with exports totaling 33 million short tons, or 44 percent of total foreign distribution. Other major sources of coal exports were Virginia and Kentucky, with exports totaling 14 million short tons and 10 million short tons, respectively. Collectively, coal exported from these three States represented 75 percent of total U.S. coal exports.

Rail continued to be the dominant method of transporting coal with 530 million short tons of shipments, 55 percent of the total (Table 65). The amount of coal transported by water, including shipments by river, shipments on the Great Lakes, and shipments through tidewater ports, accounted for 214 million short tons, or 22 percent of the total coal distributed. Distribution of coal by truck accounted for 116 million short tons, 12 percent of the total, while distribution by tramway and conveyor totaled 95 million short tons, or 10 percent of the total.

Company Name	
Top Ten Distributors	
Atlantic Richfield Co.	North American Coal Corp.
A.T. Massey Coal Co., Inc.	Peabody Holding Co.
Consol Energy Inc.	Texas Utilities Mining Co.
Cyprus AMAX Minerals Co.	The Coastal Corp.
Exxon Corp.	Zeigler Coal Holding Co.
Other Major Distributors	
Addington Resources, Inc.	Kerr-McGee Corp.
AGIP Coal Sales USA	Knife River Coal Mining
Aluminum Co. of America	Mapco Coal Inc.
American Eagle Coal Co.	Marigold Land Co.
American Electric Power	Minnesota Power & Light
American Metals & Coal	Montana Power Co.
Andalex Resources Inc.	Ohio Valley Resources, Inc.
Anker Energy Corp.	Pacificorp Electric
Apogee Coal Co.	Pen Holdings
Arch Mineral Corp.	Phibro Energy Inc.
Ashland Coal Inc.	Phoenix Resources
Bethlehem Steel Corp.	Plateau Mining Co.
BHP Utah Minerals Int'l	Pyro Energy Corp.
Black Beauty Coal Co.	Quaker Coal Co., Inc.
Centralia Mining Co.	Rochester & Pittsburgh Co.
Chevron Corp.	Sun Coal Co.
Coal Arbed Int'l Trading Co.	The Pittston Co.
Costain America Inc.	TMPA
Decker Coal Co.	Transco Energy Inc.
Drummond Company	United Coal Co.
Electric Fuels Corp.	USX Corp.
General Dynamics Corp.	Utility Fuels Inc.
James River Coal Co.	Western Fuels-Wyoming
Jim Walter Resources Inc.	Westmoreland Coal Co.
Kennecott Energy Co.	W.R. Grace & Co.

Notes: The top ten distribution companies accounted for 42 percent of the total distribution. Companies are listed in alphabetical order to ensure non-disclosure of company data.

'Source: Energy Information Administration, Form EIA-6, "Coal Distribution Report."

Table 61. Domestic Distribution of U.S. Coal by Coal-Producing Region and State, and Destination Census Division and State, 1989-1993
(Thousand Short Tons)

* Data round to zero.

Notes: Major coal-exporting States are those that exported over 900 thousand short tons. Totals may not equal sum of components due to independent rounding.

Sources: Values shown for destinations other than Canada and Mexico are estimates based upon information reported on Energy Information Administration Form EIA-6, "Coal Distribution Report," and coal export data presented in King's COALBASE (King Publishing Corp., Knoxville, Tennessee). See the Explanatory Notes for a complete description of the methodology used to develop these estimates. Values shown for Canada and Mexico are based upon Form EIA-6.

* Data round to zero.

Notes: Major coal-exporting States are those that exported over 900 thousand short tons. Totals may not equal sum of components due to independent rounding.

Sources: Values shown for destinations other than Canada and Mexico are estimates based upon information reported on Energy Information Administration Form EIA-6, "Coal Distribution Report," and coal export data presented in King's COALBASE (King Publishing Corp., Knoxville, Tennessee). See the Explanatory Notes for a complete description of the methodology used to develop these estimates. Values shown for Canada and Mexico are based upon Form EIA-6.

Demand

Domestic Markets

In 1993, domestic coal consumption rose by nearly 4 percent to 926 million short tons, a record level, led by a 4.3-percent increase in coal use at electric utility plants (Table 67). Electric utility coal consumption, which accounted for 88 percent of total U.S. coal consumption, totaled 814 million short tons, a record level and 34 million short tons more than in 1992 (Table 69). Major U.S. coal consumers in the electric utility, manufacturing, and coke sectors are presented in Table 66.

Electric Utility Use

Weather conditions were a major factor in determining the level of coal consumed by electric utilities in 1993. The weather also affected the delivery of coal to power plants. Weather conditions most notable in 1993, which affected coal, included an intense summer heatwave throughout the East and South, and severe flooding along the upper Mississippi and Missouri River Basins from June through August.

The summer heatwave in the East and South was the main cause of record levels of electricity demand in July and August. Several electric utilities set all time summer peak levels. Typically electric utilities would have a comparable increase in coal receipts in August and September. However, this did not occur in 1993 partly because of the United Mine Workers of America (UMWA) strike, extensive flooding in the Midwest which affected local and interstate rail and barge deliveries of coal, and a decision by some electric utilities to maintain a smaller inventory of coal than in the past.

Most of the increase in electric utility coal consumption was in the East North Central and East South Central Census Divisions. In Illinois, off-system sales of electricity to neighboring States led to increases in coal-fired generation. In Texas, a reduction in nuclear-powered generation, coupled with an intense summer heatwave, resulted in much greater use of coal. In Tennessee, a 79-percent decrease in nuclear-powered generation resulted in an increase in coal use.

On the other hand, double-digit increases in hydroelectric generation in both the Mountain and the Pacific

Census Divisions reduced coal requirements in those regions. Above normal precipitation in Montana resulted in an increase in less expensive hydroelectric generation and a decrease in coal-fired generation. Coal consumption in Montana dropped 18 percent from 1992. A large increase in nuclear-powered generation in the New England and Middle Atlantic Census Divisions reduced the demand for coal in those regions.

Coal Stocks

Consumer coal stocks fell to 120 million short tons in 1993 from 164 million short tons in 1992, primarily because of a 28-percent (43 million short tons) drop in coal inventories in the electric utility sector (Table 68). Among the reasons for the drop in electric utility coal stocks was a conscious decision by some electric utilities to reduce inventory costs.

Delivery Problems

A second reason for the decline in electric utility coal stocks was that the coal strike limited the available supply of coal, reduced or eliminated some shipments of coal under contract, and increased the price of spot-market coal from Appalachia and the Interior coal-producing regions. To replace contract coal not delivered because of the strike, electric utilities could have relied on the spot-market for larger quantities of coal. However, many electric utilities did not want to pay higher prices on the spot-market to replenish coal stocks and thought that an end to the strike would bring lower prices.

A third reason for the drop in stocks was the severe flooding in the Midwest during June through August which disrupted rail and barge delivery of western coal to this region and beyond. By the time the flood receded and the transportation network was repaired, delivery of western coal to many power plants was well behind schedule. During September through December 1993, congestion on the tracks and limited equipment prevented the railroads from delivering all of the western coal ordered by electric utilities in 1993. A fourth reason for the decline in electric utility stocks

was the record coal consumption in July and August. As a result, by year's end, coal stocks at electric utilities had decreased from 154 million short tons to 111 million short tons, the lowest year-end level since 1975.

Other Use

Coal consumption in 1993 at other industrial plants went up slightly, 1 percent, from the 1992 level (Table 71). However coal consumption at manufacturing plants was close to its 1992 level. Increasing or steady coal consumption at manufacturing plants in the major coal-consuming industries (chemicals, stone, clay and glass) was offset by declining coal consumption in several other manufacturing industries.

Coal consumption at coke plants declined 3 percent, from 32 million short tons in 1992 to 31 million short tons in 1993 (Table 73). Most of the decrease occurred at coke plants in Ohio and Indiana, where coal consumption declined by 1 million short tons in each State. The decline was offset partially by increased coal consumption at coke plants in Pennsylvania and West Virginia.

Residential and commercial coal consumption in 1993 was about the same as in 1992 (Table 75). Increases in coal consumption in the South Atlantic and West North Central Census Divisions were offset by decreases in coal consumption in the Middle Atlantic Census Division.

Foreign Markets

U.S. coal exports in 1993 totaled 75 million short tons, 28 million short tons less than in 1992, and the lowest level since 1979 (Table 76). Some of the contributing factors to the drop in exports were weak international demand for steam coal; a restructuring of the European steel industry; and the UMWA strike. Coal exports from all of the major U.S. coal ports declined in 1993, led by a 29-percent drop in exports through the Norfolk, Virginia, Customs District (Table 79).

U.S. metallurgical coal exports in 1993 amounted to 50 million short tons, a decrease of 16 percent from 1992 (Table 77). The largest decline, 20 percent, was in metallurgical coal shipments to Europe. In tonnage terms, there was no substantial increases in metallurgical coal exports to any of the importing countries.

Total U.S. steam coal exports in 1993 were 25 million short tons, a drop of 42 percent from the 1992 level (Table 78). Most of the decline was due to a 59 percent fall in steam coal exports to Canada and a 55 percent drop in steam coal exports to Europe. However, steam coal exports to Asia, particularly Japan, increased 13 percent. Steam coal accounted for 33 percent of total U.S. coal exports in 1993, down from 42 percent in 1992.

Domestic Markets

The Colstrip Power Plant in Montana. Over 813 million short tons of coal were consumed by U.S. electric utilities in 1993, 88 percent of total domestic coal consumption.

Coal Prices

The average mine price of U.S. coal in 1993 was \$19.85 per short ton, a drop of 6 percent from 1992, and the 11th straight year of decline. Since 1984 the average mine price of U.S. coal has declined at an average annual rate of almost 3 percent (Table 80). During this period, the average mine price of coal East of the Mississippi River declined at an average annual rate of approximately 2 percent, whereas West of the Mississippi River the decline was almost 3 percent. In real dollars, the decline over this period was 6 percent (Table 81).

Compared with 1992, the U.S. average mine price of coal in 1993 fell 7 percent in the Interior Region, 4 percent in the Western Region, and 1 percent in Appalachia. In the major coal-producing States, average mine prices fell 10 percent in Wyoming and 2 percent in West Virginia, but rose 1 percent in Kentucky.

Compared with 1992, the average delivered price of coal to U.S. consumers in 1993 declined nearly 3 percent at utilities to \$28.58 per short ton, nearly 2 percent at manufacturing plants to \$32.23 per short ton, and 1 percent at coke plants to \$47.44 per short ton (Tables 92, 94, and 96). Over the last 10 years, the average

price of coal delivered to each of these sectors has declined at an average annual rate of 2 percent. In real dollars, the average annual rate of decline of coal delivered to these sectors over this period has been between 5 and 6 percent.

The average price of U.S. coal imports in 1993 was \$29.89 per short ton, an 11-percent drop from the 1992 level (Table 98). The average price of coal imported from Colombia, which accounts for 56 percent of U.S. coal imports, dropped 15 percent, accounting for most of the decline. Over the last 10 years, the average price of U.S. coal imports has declined at an average annual rate of 2 percent.

The average price of U.S. coal exports in 1993 was \$41.41 per short ton, only a slight increase from the 1992 level (Table 99). The average price of metallurgical coal dropped 3 percent, while the average price of steam coal remained relatively unchanged. Over the last 10 years, the average price of U.S. coal exports has declined at an average annual rate of 2 percent. Metallurgical and steam coal export prices have declined at average annual rates of 2 percent and 3 percent, respectively.

Figure 14. Coal Prices, 1984-1993
(Nominal Dollars per Short Ton)

Note: Average mine prices exclude mines producing less than 10,000 short tons of coal during the year. Mine Price is calculated by dividing the total free on board (f.o.b.) mine value of the coal produced by the total production. Consumer Price is based on the cost including insurance and freight (c.i.f. cost) for electric utilities, and insurance, freight and taxes for manufacturing and coke plants, and does not include the residential and commercial sector. Export Price is based on the free alongside ship (f.a.s.) value. Import Price is based on the customs import value.

* Data round to zero.

w Withheld to avoid disclosure of individual company data.

Notes: Average mine price is calculated by dividing the total free on board (f.o.b.) mine value of the coal produced by the total production. A measure of dispersion of these average prices at the State level (interquartile range) is given in Appendix D, Table D2. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons, which are not required to provide these data.

¹ For a definition of coal-producing regions, see Appendix C.

w Withheld to avoid disclosure of individual company data.

Notes: Real prices are in 1987 dollars, calculated using implicit Gross Domestic Product price deflators. See Appendix D, Table D3. Average mine price is calculated by dividing the total free on board (f.o.b.) mine value of the coal produced by the total production. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons, which are not required to provide these data.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report;" State Mining Agency Coal Production Reports; and/or U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Coal Production Report."

Table 84. Coal Production, Number of Mines, and Average Mine Price, by State and County, 1993 (Continued)
(Thousand Short Tons, Nominal Dollars per Short Ton)

Coal-Producing State and County	Number of Mines	Production	Average Mine Price
U.S. Total	2,475	945,424	19.85

* Data round to zero.

w Withheld to avoid disclosure of individual company data.

Notes: Average mine price is calculated by dividing the total free on board (f.o.b.) mine value of the coal produced by the total production and excludes mines producing less than 10,000 short tons, which are not required to provide these data. Coal production excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Totals may not equal sum of components due to independent rounding.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report;" State Mining Agency Coal Production Reports; and/or U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Coal Production Report."

Consumer Prices

Metallurgical coal is used to make coke, as depicted in this photograph of glowing coke being pushed from a coke oven into a quenching car for cooling. The average price of coal delivered to U.S. coke plants in 1993 was \$38.20.

Import Prices

Barges transport coal on an inland waterway. Second only to rail, waterborne transportation accounted for 22 percent of total U.S. coal distribution in 1993.

¹ Based on the U.S. - Canada Free Trade Agreement, as of January 1990, the U.S. Department of Commerce began reporting statistics on U.S. exports to Canada based on information on imports provided monthly by the Canadian government.

² Includes countries with exports less than or equal to 50,000 short tons in 1992.

³ The average prices presented in this table, with the exception of U.S. Total, are considered to be representative prices for coal exports and fall within the range of \$28 to \$50 (nominal) per short ton, inclusively.

⁴ U.S. Total is the average price of all coal exports.

Notes: Real prices are in 1987 dollars, calculated using implicit Gross Domestic Product price deflators. See Appendix D, Table D3. Average prices are based on the free alongside ship (f.a.s.) value.

¹ Based on the U.S. - Canada Free Trade Agreement, as of January 1990, the U.S. Department of Commerce began reporting statistics on U.S. exports to Canada based on information on imports provided monthly by the Canadian government.

² Includes countries with exports less than or equal to 50,000 short tons in 1992.

³ The average prices presented in this table, with the exception of U.S. Total, are considered to be representative prices for coal exports and fall within the range of \$28 to \$50 per short ton, inclusively.

⁴ U.S. Total is the average price of all coal exports.

* Data round to zero.

Notes: Average price is based on the free alongside ship (f.a.s.) value. Steam coal includes bituminous, subbituminous, lignite, and anthracite.

Source: U.S. Department of Commerce, Bureau of the Census, "Monthly Report EM 545."

Coal Quality and Emissions

Estimates of recoverable U.S. coal reserves as of January 1, 1992, were 265 billion short tons (Table 105). Low-sulfur coal (0 to 0.60 pounds of sulfur per million Btu), medium-sulfur coal (0.61 to 1.67 pounds of sulfur per million Btu), and high-sulfur coal (greater than 1.67 pounds of sulfur per million Btu) accounted for 38 percent, 32 percent, and 30 percent of total recoverable reserves, respectively.

Nationally, the Btu, sulfur, and ash content of coal delivered to electric utility plants has declined over the last 10 years because (1) the use of low-sulfur coal increased, (2) coal cleaning increased, and (3) more advanced anti-pollution equipment and more efficient clean-burning technologies were introduced (Table 106).

The average Btu per pound of coal delivered to electric utilities in 1993 was 10,315, down from 10,395 in 1992. An increase in low-Btu-coal receipts from the Powder River Basin (PRB) and a decrease in coal receipts from the Appalachia and Interior coal-producing regions led to this decrease.

The average sulfur content (measured as percent sulfur by weight) of coal received at electric utilities in 1993 was 1.18 percent, down from 1.29 percent in 1992. An increase in receipts of low-sulfur coal from the PRB contributed to this decrease. In comparison, the quality of coal received at manufacturing and coke plants in 1993 showed an increase in the sulfur content (Table 107).

Nationally, over the last 5 years, sulfur dioxide emissions have decreased at an average annual rate of 2 percent. Carbon dioxide emissions have increased at an average annual rate of 1 percent, and nitrogen oxides emissions have remained about the same. These figures might seem by themselves to show only a slight gain in environmental quality over the last 5 years. However, when they are considered in the context of coal consumption at electric utility plants rising 47 million short tons (6 percent) over the same period, they do show a significant downward trend in emissions from coal-fired power plants. Table 109 presents a comparison of emissions from different types of fossil-fuel electric utility plants.

Underground	24,909	30,818	20,608	23,049	16,774	37,169	153,326

¹ Data include minor amounts of anthracite (all occurring in heat content categories greater than 23.00 million short tons) as follows: Arkansas 52.2, Colorado 13.4, New Mexico 1.2, and Virginia 70.5, expressed in million short tons.

* Data round to zero.

Note: Totals may not equal sum of components due to independent rounding.

¹ Quality units are: Btu (per pound); Sulfur (percent by weight); and Ash (percent by weight).

² Includes sulfur and ash data for coke plants.

Notes: Btu data are for manufacturing plants only. The national average of coke plant data ranges from .51 to 1.70 for sulfur and 2.6 to 10.1 for ash.

Sources: Energy Information Administration, Form EIA-3A, "Annual Coal Quality Report - Manufacturing Plants;" and Form EIA-5A, "Annual Coal Quality Report - Coke Plants."

Appendix A

Major Coal Producing States

The Kemmerer mine, located in the Hams Fork Basin region of southwestern Wyoming, is the largest and deepest open-pit coal mine in the United States. In 1993, over 3.5 million short tons were produced at this mine. Wyoming remains the largest coal-producing State, with production of over 210 million short tons in 1993.

¹ For 1984, the Form EIA-7A solicited data on "Daily Productive Capacity." To obtain annual productive capacity for a mine in 1984, each mine's daily productive capacity was multiplied by the number of days worked during the year.

² Capacity utilization (percent) is the ratio of total production to annual productive capacity as reported by mining companies on Form EIA-7A. Productivity (short tons per miner per hour) is calculated by dividing total coal production by the total direct labor hours worked by all employees engaged in production, preparation, processing, development, maintenance, repair, and shop or yard work at mining operations.

³ Imports for 1992 and 1993 include imports to electric utilities, manufacturing plants and coke plants. Imports for 1984 through 1991 include only imports to electric utilities.

⁴ Includes Mexico.

NA Not available.

Notes: Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Totals may not equal sum of components due to independent rounding.

¹ For 1984, the Form EIA-7A solicited data on "Daily Productive Capacity." To obtain annual productive capacity for a mine in 1984, each mine's daily productive capacity was multiplied by the number of days worked during the year.

² Capacity utilization (percent) is the ratio of total production to annual productive capacity as reported by mining companies on Form EIA-7A. Productivity (short tons per miner per hour) is calculated by dividing total coal production by the total direct labor hours worked by all employees engaged in production, preparation, processing, development, maintenance, repair, and shop or yard work at mining operations.

³ Includes Mexico.

* Data round to zero.

w Withheld to avoid disclosure of individual company data.

NA Not available.

Notes: Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Totals may not equal sum of components due to independent rounding.

¹ For 1984, the Form EIA-7A solicited data on "Daily Productive Capacity." To obtain annual productive capacity for a mine in 1984, each mine's daily productive capacity was multiplied by the number of days worked during the year.

² Capacity utilization (percent) is the ratio of total production to annual productive capacity as reported by mining companies on Form EIA-7A. Productivity (short tons per miner per hour) is calculated by dividing total coal production by the total direct labor hours worked by all employees engaged in production, preparation, processing, development, maintenance, repair, and shop or yard work at mining operations.

³ Imports for 1992 and 1993 include imports to electric utilities, manufacturing plants and coke plants. Imports for 1984 through 1991 include only imports to electric utilities.

⁴ Includes Mexico.

* Data round to zero.

NA Not available.

Notes: Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Totals may not equal sum of components due to independent rounding.

¹ For 1984, the Form EIA-7A solicited data on "Daily Productive Capacity." To obtain annual productive capacity for a mine in 1984, each mine's daily productive capacity was multiplied by the number of days worked during the year.

² Capacity utilization (percent) is the ratio of total production to annual productive capacity as reported by mining companies on Form EIA-7A. Productivity (short tons per miner per hour) is calculated by dividing total coal production by the total direct labor hours worked by all employees engaged in production, preparation, processing, development, maintenance, repair, and shop or yard work at mining operations.

³ Imports for 1992 and 1993 include imports to electric utilities, manufacturing plants and coke plants. Imports for 1984 through 1991 include only imports to electric utilities.

⁴ Includes Mexico.

w Withheld to avoid disclosure of individual company data.

NA Not available.

Notes: Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Totals may not equal sum of components due to independent rounding.

¹ For 1984, the Form EIA-7A solicited data on "Daily Productive Capacity." To obtain annual productive capacity for a mine in 1984, each mine's daily productive capacity was multiplied by the number of days worked during the year.

² Capacity utilization (percent) is the ratio of total production to annual productive capacity as reported by mining companies on Form EIA-7A. Productivity (short tons per miner per hour) is calculated by dividing total coal production by the total direct labor hours worked by all employees engaged in production, preparation, processing, development, maintenance, repair, and shop or yard work at mining operations.

³ Imports for 1992 and 1993 include imports to electric utilities, manufacturing plants and coke plants. Imports for 1984 through 1991 include only imports to electric utilities.

⁴ Includes Mexico.

* Data round to zero.

NA Not available.

Notes: Other States include Alaska, Arkansas, California, Georgia, Iowa, Kansas, Louisiana, Maryland, Missouri, Oklahoma, Tennessee, and Washington. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Totals may not equal sum of components due to independent rounding.

Appendix B

Metric Tables

Haul trucks such as this one, with capacities of approximately 100 tons, are used at surface mines as a link from the production area of the mine to the shipping area.

Appendix B

Metric Tables

In response to requests from international users of U.S. coal statistics, certain summary data have been converted from the customary short tons to metric. This enables U.S. statistics to be compared with data published by countries using the metric system. The con-

version to metric tons is made by multiplying short tons by 0.907185.

The data converted to metric tons are from Tables ES3, 1, 15, 24, 34, 48, 67, 68, 76, 80, 92, 94, 96, 98, and 99.

¹ For 1984, Form EIA-7A solicited data on "Daily Productive Capacity." To obtain annual productive capacity for a mine in 1984, each mine's daily productive capacity was multiplied by the number of days worked during the year.

² For a definition of coal-producing regions, see Appendix C.

w Withheld to avoid disclosure of individual company data.

NA Not available.

Notes: Productive capacity is the maximum amount of coal that can be produced as reported by mining companies on Form EIA-7A. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons, which are not required to provide these data.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report."

¹ Based on the U.S. - Canada Free Trade Agreement, as of January 1990, the U.S. Department of Commerce began reporting statistics on U.S. exports to Canada based on information on imports provided monthly by the Canadian government.

² Includes countries with exports less than or equal to 50,000 short tons (45,359 metric tons) in 1992.

* Data round to zero.

Note: Total may not equal sum of components due to independent rounding.

¹ For a definition of coal-producing regions, see Appendix C.

* Data round to zero.

w Withheld to avoid disclosure of individual company data.

Notes: Average mine price is calculated by dividing the total free on board (f.o.b.) mine value of the coal produced by the total production. A measure of dispersion of these average prices at the State level (interquartile range) is given in Appendix D, Table D2. Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons, which are not required to provide these data.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report;" State Mining Agency Coal Production Reports; and/or U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Coal Production Report."

¹ The average prices presented in this table, with the exception of U.S. Total, are considered to be representative prices for coal imports and fall within the range of \$20 to \$50 per short ton (\$18.14 to \$45.36 per metric ton), inclusively.

² U.S. Total is the average price of all coal imports.

Notes: Average price is based on the customs import value. Coal imports include coal to Puerto Rico and the Virgin Islands.

Table C1. Classification of Coals by Rank

Principles

The lower rank coals can be classified based on heat content. The heat content of the higher rank coals is generally above 14,000 Btu per pound for each coal rank group (except for meta-anthracite, which trends slightly lower), and heat content ranges vary within a relatively narrow range. Since heat content is not a dependable criterion for these higher rank coals, their rank categories are instead described by degree of metamorphism, or "coalification," a property that is measured by fixed carbon content. Finally, the agglomerating character of bituminous coals is a critical attribute for certain coal consumers, and thus agglomerating character has come to define the distinctions between certain adjacent coal groups. Some high-volatile C bituminous and subbituminous A coals can be distinguished only on the basis of agglomerating character.

Coal Rank	Coal Group	Basis of Classification		
Coals Classified by Fixed Carbon		Fixed Carbon Percentage ¹		Agglomerating Character
		Equal to or Greater than	Less than	
I. Anthracitic	1. Meta-anthracite	98	--	Non-agglomerating
	2. Anthracite	92	98	Non-agglomerating
	3. Semianthracite ²	86	92	Non-agglomerating
II. Bituminous	1. Low-volatile bituminous	78	86	Commonly agglomerating ³
	2. Medium-volatile bituminous	69 ⁴	78	Commonly agglomerating ³
	3. High-volatile A bituminous	--	69 ⁴	Commonly agglomerating ³
Coals Classified by Heat Content		Heat Content in Btu per Pound ⁵		
		Equal to or Greater than	Less than	
II. Bituminous	4. High-volatile B bituminous	13,000	14,000	Commonly agglomerating ³
	5. High-volatile C bituminous	11,500	13,000	Commonly agglomerating ³
	6. High-volatile C bituminous	10,500	11,500	Agglomerating
III. Subbituminous	1. Subbituminous A	10,500	11,500	Non-agglomerating
	2. Subbituminous B	9,500	10,500	Non-agglomerating
	3. Subbituminous C	8,300	9,500	Non-agglomerating
IV. Lignitic	1. Lignite A	6,300	8,300	Non-agglomerating
	2. Lignite B	--	6,300	Non-agglomerating

¹ Percentages are based on dry mineral-matter-free coal. Volatile matter (not shown) is the complement of fixed carbon; that is, the percentages of fixed carbon and volatile matter sum to 100 percent. As fixed carbon percentage decreases, therefore, volatile matter percentage increases by the same amount.

² If agglomerating, classify in low-volatile group of the bituminous class.

³ There may be nonagglomerating varieties in the bituminous class, most notably in the high-volatile C bituminous group.

⁴ Coals having 69 percent or more fixed carbon are classified according to fixed carbon, regardless of Btu value. Coals with less than 69 percent fixed carbon, but with 14,000 or more Btu per pound, are classified as high-volatile A bituminous.

⁵ Calorific values in Btu per pound, on a moist mineral-matter-free basis.

Note: Terms in this table are defined in the Glossary.

Coal Surveys

As early as the 1880's, the U.S. Geological Survey began collecting coal data under a voluntary reporting system. The responsibility for gathering this information was transferred to the Bureau of Mines in the 1920's, initially under the U.S. Department of Commerce and later under the U.S. Department of the Interior, which published the data in its *Minerals Yearbook*. Except for a brief period from 1937 to 1943, when bituminous coal data were collected under the mandatory authority of the Bituminous Coal Act, the Bureau of Mines continued to conduct voluntary coal surveys until the Department of Energy was created.

Coal Production Report (Form EIA-7A)

The Energy Information Administration (EIA) began collecting annual coal production data on October 1, 1977. The 1993 coal production and identification data in this report were collected on Form EIA-7A, "Coal Production Report," from companies that produced, processed, or prepared coal in 1993. All other data collected on Form EIA-7A are reported for only those companies that owned a mining operation that produced, processed, or prepared 10 thousand short tons or more of coal in 1993, and preparation plants with 5 thousand or more employee hours.

So that the EIA may fulfill its data collection functions as specified in the Federal Energy Administration Act of 1974 (Public Law 93-275), response to this survey is mandatory. The respondents to this survey are compared with lists of mining operations maintained by various State coal mining/licensing agencies and the Mine Safety and Health Administration (MSHA), U.S. Department of Labor, to identify new respondents. No sampling procedures are used. In 1993, there were 2,685 mining operations that produced, processed, or prepared 10 thousand or more short tons of coal. Of these mining operations, 78.3 percent (2,103) responded to the EIA-7A survey. In 1993, there were 2,030 mines that produced 10 thousand or more short tons of coal. Of these mines, 78.4 percent (1,592) responded to the EIA-7A survey and they accounted for 910 million short tons, or 96.3 percent of the 1993 production total. All of the data were collected by mail and were edited to ensure that they were complete and accurate.

As in all surveys, data from Form EIA-7A, "Coal Production Report," are subject to various sources of error: (1) coverage (the list of respondents may not be complete or, on the other hand, there may be double counting), (2) nonresponse (all units that are surveyed may not respond or may not provide all the information requested), (3) respondents (respondents may commit errors in reporting the data), (4) processing (the data collection agency may lose or incorrectly transcribe the submissions), (5) concept (the data collection elements may not measure the items they were intended to measure), and (6) adjustment (errors may be made in estimating values for missing data).

Because the annual coal production survey (Form EIA-7A) is not a sample survey, the estimates shown in this report are not subject to sampling error.¹ It is not possible to present estimates of nonsampling error, but precautionary steps were taken at each stage of the survey design to minimize the possible occurrence of these errors. These steps are described below.

The forms are logged within 24 hours of receipt and assigned to a team of data editors consisting of Coal

Data Systems Branch personnel. The editors screen the forms for legibility, completeness, and consistency. Names and address changes are updated in the files. The reported data are compared to data from previous years and with secondary sources such as Mine Safety and Health Administration and State mining agency reports. Inconsistencies are identified and the respondents contacted for clarification.

Computer edits are generated to identify keypunch errors, errors made by coders, out-of-range codes, and unlikely data combinations. Errors are corrected to conform to the data on the submissions or revised after telephone conversations with company representatives. All changes to reported data are documented.

Data from Form EIA-7A are maintained on an automated database at the EIA computing facility in Washington, D.C. The survey forms are filed by EIA identification number organized by State and county.

The survey forms were sent via regular mail in January with a due date of March 1, 1994. Nonresponse letters were mailed March 8 to those mining operations that had not submitted their forms. Subsequent to the letter, attempts were made to contact, by telephone, those nonrespondents whose reported 1992 production was 100 thousand short tons or more.

Some forms could not be delivered. Where possible, address corrections were obtained. In some instances, mining operations that had reported in earlier surveys or operated only in 1993 were no longer in business. Unobtainable data were derived from a secondary source: the Form 7000-2, "Quarterly Mine Employment and Coal Production Report," collected by the Mine Safety and Health Administration. / Missing production quantity data were derived from the secondary source for 657 mines, which produced 34.4 million short tons, or 3.6 percent of total production. The received and generated data sources for total U.S. coal production are shown in Table D1. Of the mines whose production exceeded 10 thousand or more short tons, missing production quantity data were derived from the secondary source for 438 mines, representing 3.5 percent (33.5 million short tons).

Missing *coalbed classification*, *coalbed thickness*, and *coal rank/group* data were estimated using State mining agency production reports, geological data, and previous years' reports for these mines.

When a mine had a missing *production value*, its production was multiplied by the county-level average mine price to estimate the value. County-level average mine prices were calculated by dividing the total value for the appropriate disposition (open/captive) and type of mining (underground or surface) by the corresponding total production. All missing production was

¹Sampling error is a measure of the variation that occurs by chance because a sample rather than a complete enumeration of units is surveyed.

Note: Coal production excludes silt, culm, refuse bank, slurry dam, and dredge production except for Pennsylvania anthracite. Number of mining operations includes preparation plants. All available State mining agency production data were reviewed, but none were included in this report because production data reported on Form EIA-7A to the Energy Information Administration and on Form 7000-1 to the Mine Safety and Health Administration were found to be complete. Totals may not equal sum of components because of independent rounding.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report"; U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Coal Production Report."

classified as open market unless information was available to classify it as captive. Of those mines whose production was 10 thousand or more short tons, value data were estimated for 531 mines, representing 5.2 percent (49 million short tons) of the production total.

When an underground mine had unreported *mining method*, it was assumed that the mining method was conventional.

Employment data include *direct labor hours*, *number of production days worked*, *average length of a production shift*, *average number of miners per shift*, and *average number of shifts per day*. Of those mines whose production exceeded 10 thousand or more short tons, one or more of these data elements were derived from secondary sources or estimated for 573 mines representing 4.4 percent (41.5 million short tons) of their production

total. Of the mining operations that produced, processed, or prepared 10 thousand or more short tons, one or more of these data elements were derived from secondary sources or estimated for 582 mining operations, or 21.7 percent of the total operations in this category.

Missing *direct labor hours* were estimated using county- or State-level productivity-per-hour averages. The averages were calculated by dividing the total production at the county or State level by total direct labor hours at the same level for the appropriate type of mining (underground or surface). The quantity of production for the mine with missing data was divided by this productivity average to derive direct labor hours.

Missing *average number of production days worked* and *length of a production shift* were derived by using the

corresponding county- or State-level average for the appropriate type of mining (underground or surface).

Missing *average number of miners per shift* was estimated as the average number of miners working daily. The average number of miners working daily was calculated by multiplying the average length of a production shift by the number of production days worked, and then dividing this number into the total direct labor hours. Missing *average number of shifts per day* was estimated as one shift per day.

Missing *recoverable coal reserves* data were estimated by using the mine's 1992 recoverable reserves minus the mine's 1993 production. If this calculation could not be made, the mine's projected production for 1994 was used. If recoverable coal reserves for 1992 and 1993 and projected production for 1994 were all missing, no estimate was made. In 1993, recoverable reserves were reported by or estimated for 1,434 mines, representing 892.9 million short tons, or 71 percent of the mines whose production exceeded 10 thousand or more short tons.

Missing *recovery percentage* data were estimated by using 1993 recovery percentage averages at the State level for the appropriate type of mining (underground or surface).

Missing *productive capacity* data were estimated by assuming productive capacity was equal to 1993 production. If productive capacity was reported as less than annual production, productive capacity was equated to 1993 production. There were 737 in-scope mines with production of 205.4 million short tons for which 1993 production was used as a proxy for productive capacity, resulting in 100 percent capacity utilization.

These mines included the MSHA generated mines, mines with productive capacity less than 1993 production, and mines that did not report productive capacity and could not be contacted. If these mines were excluded from the calculation of percent utilization, the U.S. total becomes 68.69 versus 73.72, when those mines are included.

In 1993, there were 30 mines that produced 0.7 million short tons of refuse bituminous and subbituminous coal. Those operations are not included in this report.

In order to protect the confidentiality of individual respondent's data, a policy was implemented to ensure that the reporting of survey data on mine prices and recoverable reserves in this publication would not associate those data with a particular company. The final phase in the data quality assurance and control procedures is determining which data must be suppressed (withheld) during publication to provide the necessary confidentiality for mines or companies that represent a significant portion of a reported data cell. All withholding analysis is done based upon production volumes. These procedures are performed as follows:

1. Primary Withholding Based on the Number of Respondents in a Cell -- All cells with three or fewer active coal mining operations are suppressed.
2. Residual Withholding Dominance Rule Phase 1 -- All cells containing between 4 and 10 active coal mining operations are examined. A cell is suppressed if any single respondent accounts for 75 percent or more of the volume for all respondents included in that cell.
3. Residual Withholding Dominance Rule Phase 2 -- All cells in which two active coal mining operations represent 90 percent or more of the volume for all respondents included in that cell are suppressed.
4. Complementary Suppression -- All tables are reviewed to identify cells which should have data withheld to prevent disclosure of already suppressed cells. An example of cells to be withheld during complementary suppression is underground price, if the surface price is withheld during primary or residual suppression. Because the total price is published, if the underground price is not withheld, the surface price could be calculated using the total price, the underground price, and the underground, surface, and total volumes.
5. Most complementary suppression involves type of mining considerations. Other complementary suppression is based on regional level data. A State or region must be withheld during complementary suppression because an already withheld State could be calculated using other States and the regional total. Cells are also selected for complementary suppression that represent the smallest volumes or that were withheld in prior years.
6. Inter-table effects are also examined regarding complementary suppression. For example, States that are withheld in one State table can influence the complementary suppression of an associated State table. This analysis is very similar to that done at the regional level, except that two tables are involved rather than one. Finally, similar tables are reviewed to ensure that all like suppressed cells are consistently withheld (suppressed) in all tables in which they appear.

The withholding/suppression of data is performed as an adjunct to the quality assurance (QA) procedures. The work is performed by survey editors, and the QA staff and is reviewed by the survey manager before being submitted to division-level QA review.

All sensitive cells identified in withholding analysis are denoted with the symbol/letter "W." The use of the symbol/letter applies to primary, complementary and inter-table suppressions as well as all withheld data. The symbol/letter "W" is footnoted as follows: "W Withheld to avoid disclosure of individual company data."

¹ For a definition of coal-producing regions, see Appendix C.

w Withheld to avoid disclosure of individual company data.

Note: Excludes silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons of coal during the year. Average Mine Price is calculated by dividing the total free on board (f.o.b) mine value of the coal produced by the total production.

Sources: Energy Information Administration, Form EIA-7A, "Coal Production Report;" State Mining Agency Coal Production Reports; and/or U.S. Department of Labor, Mine Safety and Health Administration, Form 7000-2, "Quarterly Mine Employment and Coal Production Report."

The interquartile range is a measure of dispersion of State-level average mine prices. Two States may have the same average mine price, but the spread about this price may be totally different. For a fixed average mine price, a larger interquartile range suggests a broader distribution of coal prices than a smaller interquartile range. The summary statistics (Table D2) given in this publication are weighted by production.

The interquartile range (weighted by production) is computed in the following manner:

- Each cell is sorted according to average mine price, from the lowest to the highest.
- For each cell, the corresponding mine's production according to increasing average mine price

is divided by that particular cell's total production and multiplied by 100. These percentages are then added as a cumulative percentage of production.

- The first quartile (Q1) is the associated mine price for which the cumulative percentage of production first passes 25 percent. Thus, at least 25 percent of that cell's total production is identified with prices at or lower than Q1.
- The third quartile (Q3), is the associated mine price for which the cumulative percentage of production first passes 75 percent. Thus, at least 75 percent of that cell's total production is identified with prices at or lower than Q3.

The interquartile range is Q3-Q1.

Quarterly Coal Consumption Report - Manufacturing Plants (Form EIA-3)

Form EIA-3 is used to survey U.S. manufacturers that consume 1 thousand tons or more of coal per year for all uses other than coke production. These data were collected on a monthly basis until 1980, when the reporting cycle was revised to a quarterly schedule. Data on manufacturers' coal stocks, receipts, prices, and consumption are reported.

Through the end of 1988, all manufacturers that consumed coal were required to file Form EIA-3. Beginning with the first quarter of 1989, only those manufacturers that consumed 1 thousand or more tons in the past year were required to report. In 1993, 768 manufacturers responded to the EIA-3 survey. The response rate for the current year was 100 percent. In order to identify undercoverage problems, the data from this survey are compared with shipments to *manufacturers* reported on EIA's "Coal Distribution Report," Form EIA-6. At present, the coal receipts reported by *manufacturers* on Form EIA-3 cover approximately 97 percent of the coal shipments to *manufacturers* on Form EIA-6. Consequently, the coal consumption data gathered on the Form EIA-3 do not represent the total consumption at manufacturing plants. See Technical Note 5 for data adjustment procedures for coal consumption for the other industrial sector.

Current year data from this survey are preliminary and unrevised in the January - March, April - June, and July - September issues of the *Quarterly Coal Report* (DOE/EIA-0121). In the October - December issue, any revisions necessary for the entire year are applied and the data are considered final.

The respondent list of manufacturers for Form EIA-3 is compared with lists of coal-consuming manufacturing plants from State Air Quality and Energy Offices. When new respondents are found, they are added to the survey mailing list.

Annual Coal Quality Report - Manufacturing Plants (Form EIA-3A)

Form EIA-3A contains questions on the origin of coal (State or Country), the quantity of coal receipts, the Btu, sulfur and ash content of the coal receipts, and the basis used to determine the coal quality data. The threshold for the annual collection will be the same as for the EIA-3: manufacturing plants that consume in excess of 1,000 short tons of coal per year. In 1993, 768 manufacturers responded to the EIA-3A survey.

The response rate for the current year was 100 percent.

Coke Plant Report (Form EIA-5)

Form EIA-5, a quarterly report of coal receipts, carbonization, and stocks, and of coke and breeze production, distribution, and stocks, is used to survey all U.S. coke plants.

Coke plants were surveyed monthly and a supplemental survey was taken annually until 1981, when the reporting cycle was revised to a quarterly schedule with an annual supplemental survey. In 1985, collection of the annual supplement was ended.

In 1993, there were 33 respondents to the EIA-5 survey, and the response rate was 100 percent. The respondent list for this survey is updated by continuous monitoring of the industry literature.

Current year data from this survey are preliminary and unrevised in the January - March, April - June, and July - September issues of the *Quarterly Coal Report* (DOE/EIA-0121). In the October - December issue, any revisions necessary for the entire year are applied and the data are considered final.

Annual Coal Quality Report - Coke Plants (Form EIA-5A)

This form contains questions on the origin of coal (State or Country), the quantity of coal receipts, the volatile matter, sulfur and ash content, and the basis used to determine the coal quality data. There is no threshold for this form. In 1993, there were 33 respondents to the EIA-5A survey, and the response rate was 100 percent.

Coal Distribution Report (Form EIA-6)

Form EIA-6 is used to survey all U.S. companies (producers and/or distributors) that own or purchase and distribute more than 50 thousand short tons annually.² Data on coal production and purchases, distribution by consumer category, and method of transportation are reported.

In 1993, there were over 1,100 respondents to the EIA-6 survey. Until the end of 1988, coal distribution companies were required to report production on a Bureau of Mines district basis. For the year 1989, re-

²For the States of Arkansas, Maryland, Oklahoma, and the anthracite portion of Pennsylvania, the threshold is 10,000 tons.

spondents were required to report on a BOM district/State basis. Beginning with the first quarter of 1990, respondents were required to report on a State basis. The response rate for the current quarter was 100 percent. The annual production total reported on Form EIA-6 exceeds 99 percent of total production as reported by all mines on Form EIA-7A, "Coal Production Report," due to the difference in reporting thresholds. The data gathered on the Form EIA-6 only represent the domestic coal distributed during the quarter. Therefore, imported coal distributed during the quarter is not included.

Current year data from this survey are preliminary and unrevised in the January - March, April - June, and July - September issued of the *Quarterly Coal Report* (DOE/EIA-0121). In the October - December issue, any revisions necessary for the entire year are applied and the data are considered final.

The respondent list for this survey is updated by comparing it with lists of coal producers from the Mine Safety and Health Administration (MSHA), U.S. Department of Labor, and from similar lists maintained by various State agencies. Also, new respondents are frequently identified on Form EIA-6 itself when other companies are named as sources of coal purchases.

Electric Utility Surveys

Coal data appear in this report from three surveys of electric utilities - from all generating electric utilities and from fossil-fueled plants.

The Census Bureau collected and published the results of a census taken every 5 years from 1902 to 1937 on the electric light and power industries and some data on industrial production of electric energy. The U.S. Geological Survey collected data on capacity and generation of electric utilities from 1920 to 1936, when this activity was turned over to the Federal Power Commission (FPC).

All data are presented as reported on the surveys. No estimates or other adjustments are made for missing data. The data are maintained in a computer system and are edited to ensure that they are reasonable, consistent, and complete. For additional information from these surveys and for other electric utility data, see the EIA publication, *Electric Power Monthly* (DOE/EIA-0226).

Monthly Power Plant Report (Form EIA-759)

Form EIA-759 (which, until 1982, was called FPC Form 4) is used to survey all generating electric utilities. The Federal Power Act and FPC Order Number 141 define the legislative authority to collect power production data. Consumption and stocks of coal and other fuels at each plant are reported. The respondents to Form EIA-759, approximately 3 thousand plants, account for 100 percent of total electric utility generation.

Current year data from this survey are considered final.

Monthly Report of Cost and Quality of Fuels for Electric Plants (FERC Form 423)

Federal Energy Regulatory Commission (FERC) Form 423 is used to survey all fossil-fueled plants with a total steam-generating capacity of 50 megawatts or more. It is submitted by approximately 230 electric utilities. (Before 1983, this form was called FPC Form 423, and all fossil-fueled plants with a total generating capacity of 25 megawatts or more were surveyed.) In 1972, the FPC issued Order Number 453, which included the legislative authority to create FERC Form 423. Cost, quality, and source of fuels (by State or country of origin), including coal, are reported. Current year data from this survey are considered final.

Steam-Electric Plant Operation and Design Report (Form EIA-767)

The Form EIA-767 is a mandatory restricted-universe census of all electric power plants with a total existing or planned organic- or nuclear-fueled steam-electric generator nameplate rating of 10 or more megawatts. The entire form is filed by approximately 700 power plants with a nameplate capacity of 100 or more megawatts. An additional 200 power plants with a nameplate capacity between 10 and 100 megawatts submit information only on fuel consumption/quality, boiler/generator configuration, and flue-gas desulfurization equipment, if applicable. The Form EIA-767 is used to collect data annually on plant operations and equipment design (including boiler, generator, cooling system, flue gas desulfurization, flue gas particulate collectors, and stack data). Data from the Form EIA-767 are used for economic, regulatory, and environmental analyses conducted by the DOE, the FERC, the Environmental Protection Agency, and the Department of Commerce.

Form EIA-767 data for 1993 are preliminary. Data for prior years are final.

Annual Nonutility Power Producer Report (Form EIA-867)

The Form EIA-867 is a restricted-universe census used to collect annual data from all existing and planned nonutility power producers in the United States. In 1992, the reporting threshold of the Form EIA-867 was lowered to include all facilities with a combined nameplate capacity of 1 or more megawatts. Previously data were collected every 3 years from facilities with a nameplate capacity between 1 and 5 megawatts. For the purpose of this data collection, a nonutility power producer is an enterprise that has electric generating capacity and is not an electric utility. They include qualifying cogenerators, qualifying small power producers, and other nonutility generators (including independent power producers) without a designated franchised service area. The form is used to collect data on the installed capacity, energy consumption, generation, and electric energy sales to electric utilities from approximately 2,000 facilities.

Form EIA-867 data for 1993 are preliminary. Data for prior years are final.

Export and Import Data

Export and import data (except imports to electric utilities, manufacturing plants and coke plants, which are reported on the FERC Form 423, EIA-3A, and EIA-5A, respectively.) are obtained from the Census Bureau--export data from the monthly EM 545 (formerly EM 522) report, import data from the monthly IM 145 report. The Census Bureau compiles these data monthly from documents filed with the U.S. Customs Service as required by law. They include shippers' export declaration forms, import entry forms, and warehouse withdrawal forms. No sampling procedures are used. The Census Bureau publication *Guide to Foreign Trade Statistics* describes the foreign trade statistics program, including the EM 545 and IM 145 monthly reports. Data from these surveys are considered final at the time of publication.

Foreign distribution of U.S. coal, major exporting State, and destination, along with foreign distribution of metallurgical and steam coal (Tables 62, 63, and 64, respectively), was determined using EIA-6 distribution data by origin State, and coal export data from King's COALBASE (King Publishing Corporation, Knoxville, Tennessee) which gives the metallurgical and steam as well as the destination country data. The percentage of metallurgical and steam coal for each country of destination are applied to the EIA-6 export

figures for each State of origin to derive coal distribution data that links State of origin to countries of destination by type of coal. The King's destination country data are considered to be more accurate than the Census country of destination data because it accounts for transshipments through intermediate countries to final destination countries, whereas the Census data would designate the destination as the intermediate country.

Copies of the survey forms and instructions used to collect data appearing in this publication can be obtained by calling EIA's National Energy Information Center at (202) 586-8800.

Technical Notes

1. Differences in Related Coal Data

Coal Production versus Coal Distribution. Coal production represents newly-mined coal. Coal distribution represents shipments of newly-mined coal and coal from producer/distributor stockpiles (previously mined coal).

Coal Distribution versus Coal Receipts. Differences in coal distribution data and coal receipts data are due to the time lag between distribution and receipt of coal shipments, and due to the survey threshold differences. In addition, coal distributed includes only domestic coal, whereas receipts include imported coal.

Foreign Distribution of U.S. Coal versus U.S. Coal Exports. Foreign distribution of U.S. coal does not equal U.S. coal exports due to reporting time differences and survey threshold differences.

Receipts of Imported Coal versus U.S. Coal Imports. Receipts of imported coal at electric utilities and manufacturing and coke plants does not equal U.S. coal imports due to reporting time differences. In addition, it does not include receipts at independent power producers.

2. Other Industrial Plants and Manufacturing

The *other industrial plants* end-use sector includes the *manufacturing*, agriculture, forestry and fishing, mining, and construction industries. Manufacturing accounts for approximately 97 percent of the coal receipts and consumption and 100 percent of the coal stocks in

the *other industrial plants* sector as reported herein. Data sources for the *other industrial plants* sector and the *manufacturing* sector are Forms EIA-6 and EIA-3, respectively. The source statement in each table identifies the survey used to collect coal data for the *other industrial plants* sector, and the following technical notes describe the methodology used when data were derived.

3. Residential and Commercial

To reduce the reporting burden to coal users, the EIA does not conduct any survey of coal data from residential and commercial users of coal. Shipments of coal to this sector, reported by producers and distributors of coal on Form EIA-6, are equated to coal receipts and consumption by the *residential and commercial* sector, assuming no stock changes.

4. Consumer Prices

Prices are derived for each end-use sector as follows:

Electric Utilities. Prices are reported for each plant in cents-per-million Btu on FERC Form 423. The price per ton of coal is calculated at each plant using cents-per-million Btu and the average Btu content per pound of coal for the appropriate rank of coal. The average prices appearing in the tables (e.g., across all States) are calculated by summing the dollar value at each plant (short tons of coal multiplied by price per short ton) and dividing by the corresponding total tons. For more information about prices of coal at *electric utilities*, see the EIA publication, *Electric Power Monthly* (DOE/EIA-0226).

Coke Plants. Respondents are asked to report the number of tons of coal received (or coke distributed) on Form EIA-5 and the total value of that coal (or coke) in dollars. Average prices are calculated by summing the reported values (e.g., across all States) and dividing by the corresponding total tons.

Other Industrial Plants. Respondents (manufacturing plants only) are asked to report the number of tons of coal received on Form EIA-3 and the total value of that coal in dollars. Average prices are calculated by summing the reported values across all States and dividing by the corresponding total tons.

Residential and Commercial. Data are not collected. See Technical Note 3.

5. Consumption

Annual Data

Annual coal consumption data are sums of quarterly or monthly data described below except for nonutility power producers whose coal consumption is not included in this report. These data are however, reported on Form EIA-867 and published in the *Electric Power Annual* (DOE/EIA-0348).

Electric Utilities. Consumption is reported on Form EIA-759.

Coke Plants. Consumption is reported on Form EIA-5.

Other Industrial Plants. In deriving a quarterly estimate for coal consumption for the *other industrial plants* sector, the first step is to equate consumption to beginning stocks plus receipts minus ending stocks. In terms of an equation, consumption can be expressed as $C = S_b + R - S_e$, where S_b = beginning stocks, R = receipts, and S_e = ending stocks.

Therefore, consumption is $C = (S_b - S_e \text{ (change in stocks)}) + R$. Next, stock change at the State level is equated to the stock change for that State as reported on Form EIA-3, receipts at the State level are derived as described in Section 3, and a computed consumption is derived using the same equation for each State. Finally, the quarterly consumption (C) at the State level is equated to the maximum of the computed consumption at the State level, as previously described, and the quarterly consumption for that State as reported on Form EIA-3. This process ensures that State-level consumption for the *other industrial plants* sector is always greater than or equal to the *manufacturing* sector consumption for that State. Total quarterly consumption for the *other industrial plants* sector is computed by summing the quarterly State-level consumption figures.

Residential and Commercial. Shipments to the *residential and commercial* sector as reported on Form EIA-6 are defined as consumption as well as receipts for this end-use sector.

EIA publishes monthly estimates of coal consumption in the *Monthly Energy Review* (DOE/EIA-0035).

Monthly coal consumption at electric utility plants is derived directly from Form EIA-759. Prior to 1980, monthly coal consumption at coke plants was derived directly from Form EIA-5. For 1981 through 1987, it was derived from the quarterly coal consumption reported on Form EIA-5, using the ratios of monthly to quarterly consumption in 1979, the last year that coke plant data were collected monthly on Form EIA-5. These ratios by month (January - December) are

0.3377, 0.3200, 0.3423; 0.3529, 0.3462, 0.3009; 0.3364, 0.3347, 0.3289; and 0.3273, 0.3301, 0.3426.

Starting with 1988, monthly coal consumption at coke plants is derived from quarterly coal consumption reported on Form EIA-5, using ratios derived from monthly data on raw steel production published by the American Iron and Steel Institute (AISI) on Form AIS7. The ratio is the proportion of monthly raw steel production from open hearth and basic oxygen process furnaces to the quarterly raw steel production from those furnace types.

Prior to 1978, coal consumption for the *other industrial plants* sector (i.e., industrial users minus coke plants) was derived by using monthly data reported on Form EIA-3 to modify baseline coal consumption figures from the most recent Census of Manufactures or Annual Survey of Manufactures, Bureau of the Census, U.S. Department of Commerce. For 1978 through 1987, data from Forms EIA-3 and EIA-6 are used to compute monthly coal consumption for the *other industrial plants* sector.

Given the quarterly consumption for the *other industrial plants* sector (C), the monthly consumption for the sector (C_m) is estimated for each month in the quarter as $C_m = (C_{m3}/C_3) \times C$ where C_{m3}/C₃ is the ratio of monthly to quarterly coal consumption as reported on Form EIA-3. For the 1978 coal consumption figures, the ratios used are based on 1978 EIA-3 data. For 1979 through 1987, the ratios used are based on the 1979 EIA-3 data. These 1979 ratios by month (January - December) are 0.3593, 0.3264, 0.3143; 0.3485, 0.3332, 0.3183; 0.3317, 0.3407, 0.3276; and 0.3045, 0.3253, 0.3702.

Starting with 1988, monthly coal consumption for the other industrial plants sector is derived from quarterly coal consumption reported on Form EIA-3 using monthly ratios derived from the industrial production indices published by the Board of Governors of the Federal Reserve System. Six major industry groups' indices are used as the basis for calculating the monthly ratios. These groups are foods (Standard Industrial Classification (SIC) 20), paper and products (SIC 26), chemicals and products (SIC 28), petroleum products (SIC 29), clay, glass, stone products (SIC 32), and primary metals (SIC 33).

The monthly ratios are computed as the monthly sum of weighted indices as a proportion of the quarterly sum of weighted indices, using the 1985 proportion as the weight.

Prior to 1980, monthly coal consumption for the *residential and commercial* sector was derived by using monthly data reported on Form EIA-2, "Monthly Coal Report - Retail Dealers and Upper Lake Docks," to modify baseline coal consumption figures developed by the Bureau of Mines, U.S. Department of the Interior.

For 1980, the quarterly coal consumption figures in the *residential and commercial* sector are converted to monthly coal consumption figures using the ratios of monthly to quarterly coal deliveries to this sector in 1979 as reported on Form EIA-2. These 1979 ratios by month (January-December) are 0.4002, 0.3502, 0.2496; 0.4805, 0.2901, 0.2294; 0.3126, 0.2952, 0.3922; and 0.2931, 0.3101, 0.3968. The 1981 and 1982 monthly coal consumption figures were derived using the 1979 ratios but were also modified according to heating/cooling degree-days. For 1983 through 1987, coal consumption figures are converted to monthly coal consumption figures using only the ratios of monthly to quarterly coal deliveries to this sector in 1979.

Starting with 1988, monthly coal consumption figures are derived using the monthly national average population weighted heating/cooling degree-days obtained from the National Oceanic and Atmospheric Administration. The ratio is the proportion of the monthly national sum of heating and cooling degree-days to the quarterly sum.

6. Stocks

Annual stocks are calculated at the end of the year or the end of the 4th quarter. Coal stocks are derived for each end-use sector as follows:

Electric Utilities. Stocks are reported on Form EIA-759.

Coke Plants. Stocks are reported on Form EIA-5.

Other Industrial Plants. Stocks are reported on Form EIA-3, i.e., stocks at *manufacturing* plants only. Technical Note 1 discusses the difference between *other industrial plants* and *manufacturing plants*.

Residential and Commercial. Data are not available. See Technical Note 3.

Producer and Distributor. Stocks are reported on Form EIA-6.

7. Methods of Transportation

Rail: Shipments of coal moved to consumers by rail, either private or public/commercial. Included is coal hauled to or away from a railroad siding by truck.

Water Transportation: Shipments of coal moved by one of the three methods--river, Great Lakes, or tidewater piers and coastal ports. Included in these shipments is

coal hauled to or from water-loading facilities by other means of transportation.

River: Shipments of coal moved to consumers via river by barge, except shipments to Great Lakes coal-loading docks or tidewater piers or coastal ports.

Great Lakes: Shipments of coal moved to consumers via the Great Lakes. These shipments are moved via the Great Lakes coal-loading docks, which are identified by name and locations as follows: Superior Midwest Energy Terminal, Superior, Wisconsin; Bessemer & Lake Erie Coal Storage & Transfer Facility, Conneaut, Ohio; B&O Railroad Coal-Loading Dock, Lorain, Ohio; C&O Railroad Presque Isle Docks, Toledo, Ohio; Lakefront Dock & Railroad Terminal Company Coal-Loading Dock, Toledo, Ohio; N&W Sandusky Coal Pier No. 3, Sandusky, Ohio; ConRail Coal Transfer Facilities, Ashtabula, Ohio; Rail to Water Transfer Corporation Dock, Chicago, Illinois.

Tidewater Piers and Coastal Ports: Shipments of coal moved to tidewater piers and coastal ports for further shipments to consumers via coastal water or ocean. The tidewater piers are identified by name and location as follows: B&O Curtis Bay Coal Piers, Baltimore, Maryland; C&O Coal Piers Nos. 14 & 15, Newport News, Virginia; N&W Lamberts Point Coal Piers Nos. 5 & 6, Norfolk, Virginia; Alabama State Docks Bulk Handling Plant, Mobile, Alabama; Alabama State Docks/McDuffie Terminals, Mobile, Alabama; Canton Coal Piers, Baltimore Harbor on the Chesapeake Bay; Greenwich Coal Pier, Greenwich Point, Philadelphia, Pennsylvania, on Delaware River; Port Richmond Pier, Pier 18 Port Richmond, Philadelphia, Pennsylvania, on the Delaware River; Galveston Regional Coal Distribution Center, Pelican Island, Galveston, Texas; International Marine Terminals/Plaquemines Parish Terminal, Mile 57 AHP-Mississippi River, approximately 30 miles south of New Orleans; Energy Terminals of Houston, Inc., a Subsidiary of Soros Associates, Houston, Texas. Coastal Ports are those located at Charleston, South Carolina; New York, New York; San Diego, California; Los Angeles, California; and Seattle, Washington.

Truck: Shipments of coal moved to consumers by truck.

Tramway, Conveyor, or Slurry Pipeline: Shipments of coal moved to consumers by tramway, conveyor, or slurry pipeline.

8. Census Export and Import Data

Export and import data are obtained from the Bureau of the Census, U.S. Department of Commerce, where they are compiled monthly from documents filed with the U.S. Customs Service, as required by law.

Each coal shipment is reported in short tons with corresponding total dollar values. EIA converts all value data obtained from the Census Bureau to average price data by dividing the dollar value by the quantity.

Based on an analysis and sample validation of the Census Bureau import and export data conducted by the EIA, it was determined that some of the coal and coke data collected from the Census Bureau may be misleading or incorrect (particularly those data associated with very small quantities or very high prices). Because of this, a methodology was developed to edit the Census Bureau price data.

Prior to 1989, certain data cells had been suppressed for publication purposes only: (1) average import coal prices of \$50.00 or more per short ton; (2) average export coal prices of \$60.00 or more per short ton; (3) average coke prices of \$200.00 or more per short ton; (4) all percent changes of 500 percent or more.

Beginning with 1989, coal export data were categorized as metallurgical coal and steam coal, rather than as bituminous steam coal, lignite, anthracite, and bituminous metallurgical coal.

In addition, coal export tables were revised to present those countries to which the United States exported more than 50,000 short tons in the prior calendar year. The remaining countries in each continent were aggregated in an "other" category. This reduces the number of empty cells and highlights the major importers of U.S. coal. All coke export and import, and coal import countries and quantities are displayed.

The following methodology was used to derive the typical average prices as presented in the price tables. For all coal, a price distribution was derived from the prior calendar year export price data. Since extreme price variations in the Census Bureau data are the exception rather than the rule, the price distribution was used to identify a typical price range. The price distribution, from low to high, along with the frequency of each price (quantity) was analyzed to determine the representative prices. The extreme prices at both ends of the distribution were eliminated to arrive at a price range that covered at least 90 percent of the exports. This price range was considered to include typical or representative prices. Considering the records that fell within the typical price range, the weighted average price was calculated by country of destination and type of coal.

The same procedure was used to determine the typical average prices of coal imports. In addition to the average prices based on the above methodology, a U.S. total row is presented in the price tables, which represents the average price using all the Census Bureau data.

For reporting purposes, the month of exportation reflects the month in which the shipment leaves the United States. The month of importation generally is

based on the month in which the U.S. Customs Service releases the merchandise to the importer. For both sets of data, however, there can exist a small carry-over from the actual month of exportation or importation to a subsequent month, usually the succeeding month. A number of factors in processing account for this, e.g., late receipt of a document for an end-of-month shipment, or rejection of a shipment by the computer due to failure to meet established edit criteria. These limitations should be considered when making comparisons.

Based on the U.S. - Canada Free Trade Agreement, as of January 1990, the U.S. Department of Commerce began reporting statistics on U.S. exports to Canada based on information on imports provided monthly by the Canadian government.

Comparing Census reported imported coal figures in Table 34 with EIA reported imported coal receipts at electric utilities, manufacturers, and coke plants for 1993 shows a difference of about 1.8 million short tons. The main reason for this is that the EIA receipts data do not cover imported coal received by nonutility power producers who are not in the manufacturing sector.

9. Metric Data

Selected quarterly tables are converted to metric tons by multiplying the underlying data by the factor .907185. The metric data in Appendix B are derived from the following tables:

Tables ES1, 1, 15, 24, 34, 48, 67, 68, 76, 80, 91, 93, 95, 98, and 97 and are presented, respectively, in Tables B1. through B15.

10. Revisions

The Office of Coal, Nuclear, Electric and Alternate Fuels has adopted the following policy with respect to the revision and correction of recurrent data in energy publications:

1. Annual survey data collected by this office are published either as preliminary or final when first appearing in a data report. Data initially released as preliminary will be so noted in the report. These data will be re-

vised, if necessary, and declared final in the next publication of the data.

2. All monthly and quarterly survey data collected by this office are published as preliminary. These data are revised only after the completion of the 12-month cycle of the data. No revisions are made to the published data before this.

3. After data are published as final, corrections will be made only in the event of a greater than one percent difference at the national level. Corrections for differences that are less than the one percent threshold are left to the discretion of the Office Director.

11. Approximate Heat Content of Coal

Table C2 presents the approximate heat content of coal by rank and disposition for 1980 through 1993.

12. Price Data and Taxes

F.O.B. mine coal prices and prices of coal delivered to or received by end-use consumers (electric utility plants, manufacturing plants, and coke plants) as reported in this publication include relevant local, state and federal excise and sales taxes.

Table D3. Gross Domestic Product, Implicit Price Deflator, 1983-1993

Year	Implicit Price Deflator (1987 = 100)
1983	87.2
1984	91.0
1985	94.4
1986	96.9
1987	100.0
1988	103.9
1989	108.5
1990	113.3
1991	117.7
1992	121.1
1993	124.2

Glossary

Agglomerating Character: Agglomeration describes the caking properties of coal. Agglomerating character is determined by examination and testing of the residue when a small powdered sample is heated to 950 degrees centigrade under specified conditions. If the sample is "agglomerating," the residue will be coherent, show swelling or cell structure, and be capable of supporting a 500-gram weight without pulverizing.

Anthracite: A hard, black lustrous coal, often referred to as hard coal, containing a high percentage of fixed carbon and a low percentage of volatile matter. Comprises three groups classified according to the following ASTM Specification D388-91a, on a dry mineral-matter-free (mmf) basis:

	Fixed Carbon Limits		Volatile Matter	
	GE	LT	GT	LE
Meta-Anthracite	98	-	-	2
Anthracite	92	98	2	8
Semianthracite	86	92	8	14

GE = Greater than or equal to
LT = Less than
GT = Greater than
LE = Less than or equal to

Anthracite coal is non-agglomerating. If agglomerating, semianthracite is classified in the low-volatile group of the bituminous class.

Ash: Impurities consisting of silica, iron, alumina, and other incombustible matter that are contained in coal. Ash increases the weight of coal, adds to the cost of handling, and can affect the burning characteristics. Ash content is measured as a percent by weight of coal on an "as received" or a "dry" (moisture-free, usually part of a laboratory analysis) basis.

Auger Mine: A surface mine where coal is recovered through the use of a large-diameter drill driven into a coalbed in a hillside. It usually follows contour surface mining, particularly when the overburden is too costly to excavate.

Average Annual Percent Change:

$$\sqrt[n]{\frac{V_n}{V_0}} - 1 \quad (1)$$

Where: V_0 = the value for the base period.

V_n = the value for the n^{th} period.

n = the number of periods.

Average Daily Production: The ratio of the total production at a mining operation to the total number of production days worked at the operation.

Average Length of a Shift: The arithmetic mean number of hours worked during a production shift. Overtime is included if usually worked during the year.

Average Mine Price: The ratio of the total value of the coal produced at the mine to the total production tonnage. (See f.o.b. mine price.)

Average Number of Employees per Shift: The arithmetic mean number of employees working during a production shift. Includes all employees except office workers. (See direct labor hours.)

Average Number of Miners Working Daily: The arithmetic mean number of miners working each day at a mining operation. Includes maintenance as well as production work performed.

Average Number of Shifts per Day: The arithmetic mean number of shifts each day at a mining operation. Includes maintenance as well as production shifts.

Average Production per Miner per Day: The product of the average production per miner per hour at a mining operation and the average length of a production shift at the operation.

Average Production per Miner per Hour: The ratio of the total production at a mining operation to the total direct labor hours worked at the operation.

Average Production per Miner per Shift: Calculated by multiplying average production per miner per hour by the average length of a miner shift.

Average Quality of Coal: Refers to individual measurements such as heat value, fixed carbon, moisture, ash, sulfur, phosphorus, major, minor, and trace elements, coking properties, petrologic properties, and particular organic constituents. The individual quality elements may be aggregated in various ways to classify coal for such special purposes as metallurgical, gas, petrochemical, and blending usages.

Average Recovery Percentage: Average recovery percentage represents the percentage of coal that can be recovered from coal reserves at reporting mines, averaged for all mines in the reported geographic area.

Bituminous Coal: The most common coal. It is dense and black (often with well-defined bands of bright and dull material). Its moisture content is usually less than 20 percent. It is used for generating electricity, making coke, and for space heating. Comprises five groups classified according to ASTM Specification D-388-91a, on a dry mineral-matter-free mmf basis for fixed-carbon and volatile matter and a moist mmf basis for calorific value. Coals having 69 percent or more fixed carbon on the dry, mineral-matter-free basis shall be classified according to fixed carbon, regardless of calorific (heating) value. High-volatile C bituminous coal is agglomerating, but other bituminous coals are commonly agglomerating. However, it is recognized that there may be nonagglomerating varieties in these groups of the bituminous class, and there are notable exceptions in the high-volatile C bituminous group. Coals with less than 69 percent fixed carbon, but with 14,000 or more Btu per pound, are classified as high-volatile A bituminous.

	Fixed Carbon Limits		Volatile Matter Limits		Calorific Value Limits Btu/lb.	
	GE	LT	GT	LT	GE	LE
lv	78	86	14	22	-	-
mv	69	78	22	31	-	-
hva	-	69	31	-	14000	-
hvb	-	-	-	-	13000	14000
hvc	-	-	-	-	10500	13000

lv = Low-volatile bituminous coal
mv = Medium-volatile bituminous coal
hva = High-volatile A bituminous coal
hvb = High-volatile B bituminous coal
hvc = High-volatile C bituminous coal

GE = Greater than or equal to
LT = Less than
GT = Greater than
LE = Less than or equal to

Btu (British thermal unit): The amount of heat needed to raise the temperature of 1 pound of water by 1 degree fahrenheit. The Btu is a convenient measure by which to compare the energy content of various fuels.

Cannel Coal: A variety of bituminous coal that is noncaking, contains a high percentage of volatile matter, ignites easily, and burns with a luminous smokey flame.

Capacity Utilization: Capacity utilization is computed by dividing production by productive capacity and multiplying by 100.

Captive Coal: Coal produced and consumed by the mine operator, a subsidiary, or parent company (for example, steel companies and electric utilities).

Carbon Dioxide: CO_2 . A colorless, odorless, incombustible gas formed during combustion in fossil-fuel electric generation plants.

Census Divisions: The nine geographic divisions of the United States established by the Bureau of the Census, U.S. Department of Commerce for statistical analysis. The boundaries of Census divisions coincide with State boundaries. In some cases, the Pacific Division is subdivided into the Pacific Contiguous and Pacific Noncontiguous areas.

CIF: See Cost, Insurance, Freight.

Coal Carbonized: The amount of coal decomposed into solid coke and gaseous products by heating in a coke oven in a limited air supply or in the absence of air.

Coal (Coke): See Coke (coal).

Coal Mining Productivity: Coal mining productivity is calculated by dividing total coal production by the total direct labor hours worked by all mine employees.

Coal Preparation: The process of sizing and cleaning coal to meet market specifications by removing impurities such as rock, sulfur, etc. May include crushing, screening, or mechanical cleaning.

Coal-Producing Regions: A geographic classification of coal-producing States. The States in the Appalachian Region are Alabama, Georgia, eastern Kentucky, Maryland, Ohio, Pennsylvania, Tennessee, Virginia, and West Virginia. The States in the Interior Region are Arkansas, Illinois, Indiana, Iowa, Kansas, western Kentucky, Louisiana, Missouri, Oklahoma, and Texas. The States in the Western Region are Alaska, Arizona, California, Colorado, Montana, New Mexico, North Dakota, Utah, Washington, and Wyoming.

Coal-Producing States: The States where mined and/or purchased coal originates are defined as follows: Alabama, Alaska, Arizona, Arkansas, California, Colorado, Illinois, Indiana, Iowa, Kansas, Kentucky Eastern, Kentucky Western, Louisiana, Maryland, Missouri, Montana, New Mexico, North Dakota, Ohio, Oklahoma, Pennsylvania anthracite, Pennsylvania bituminous, Tennessee, Texas, Utah, Virginia, Wash-

ington, West Virginia Northern, West Virginia Southern, and Wyoming.

The following Coal-Producing States are split in origin of coal, as defined below:

Kentucky, Eastern: All mines located in counties other than the Western Kentucky counties.

Kentucky, Western: All mines in the following counties in Western Kentucky: Butler, Caldwell, Christian, Crittenden, Daviess, Edmonson, Grayson, Hancock, Henderson, Hopkins, Logan, McLean, Muhlenberg, Ohio, Simpson, Todd, Union, Warren, and Webster.

Pennsylvania Anthracite: All mines in the following counties: Carbon, Columbia, Dauphin, Lackawanna, Lebanon, Luzerne, Northumberland, Schuylkill, Sullivan, and Susquehanna. All anthracite mines in Bradford County.

Pennsylvania Bituminous: All mines located in counties other than the Pennsylvania anthracite counties and all bituminous mines in Bradford County.

West Virginia, Northern: All mines in the following counties (formerly defined as Coal-Producing Districts 1, 3, & 6): Barbour, Brooke, Braxton, Calhoun, Doddridge, Gilmer, Grant, Hancock, Harrison, Jackson, Lewis, Marion, Marshall, Mineral, Monongalia, Ohio, Pleasants, Preston, Randolph, Ritchie, Roane, Taylor, Tucker, Upshur, Webster, Wetzel, Wirt, and Wood.

West Virginia, Southern: All mines in the following counties (formerly defined as Coal-Producing Districts 7 & 8): Boone, Cabell, Clay, Fayette, Greenbrier, Kanawha, Lincoln, Logan, Mason, McDowell, Mercer, Mingo, Monroe, Nicholas, Pocahontas, Putnam, Raleigh, Summers, Wayne, and Wyoming.

Coal Rank/Group: A classification of coal based on fixed carbon, volatile matter, calorific (heating) value, and agglomerating character. Coal is ranked progressively from lignite (least carbonaceous) to anthracite (most carbonaceous). The rank of coal can also be determined by measuring the reflectance of vitrinite, one of several organic components of coal. The lower rank coal can be classified based on heat content. The heat content of the higher rank coals is generally above 14,000 Btu per pound for each coal rank group (except for meta-anthracite, which trends slightly lower), and heat content ranges vary within a relatively narrow range. Since heat content is not a dependable criterion for these higher rank coals, their rank categories are instead described by degree of metamorphism, or "coalification", a property that is measured by fixed carbon content. Finally, the agglomerating character of bituminous coals is a critical attribute for certain coal consumers, and thus agglomerating character has come to define the distinctions between certain adjacent coal groups. Some high-volatile C bituminous and

subbituminous A coals can be distinguished only on the basis of agglomerating character. Percentages are based on dry mineral-matter-free coal. Volatile matter (not shown) is the complement of fixed carbon; that is, the percentages of fixed carbon and volatile matter sum to 100 percent. As fixed carbon percentage decreases, therefore, volatile matter percentage increases by the same amount.

Coal Stocks: The supply of coal at a mine, plant, or utility at the end of the reporting period.

Coalbed: A bed or stratum of coal. Also called a coal seam.

Cogenerator: A generating facility that produces electricity and another form of useful thermal energy (such as heat or steam) used for industrial, commercial, heating, and cooling purposes. To receive status as a qualifying facility (QF) under the Public Utility Regulatory Policies Act (PURPA), the facility must produce electric energy and "another form of useful thermal energy through the sequential use of energy," and meet certain ownership, operating, and efficiency criteria established by the Federal Energy Regulatory Commission (FERC). (See the Code of Federal Regulation, Title 18, Part 292.)

Coke (coal): In general, coke is made from bituminous coal (or blends of bituminous coal) from which the volatile constituents are driven off by baking in an oven at temperatures as high as 2,000 degrees Fahrenheit, so that the fixed carbon and ash are fused together. Coke is hard and porous, has a gray, submetallic luster, and is strong enough to support a load of iron ore in a blast furnace. It is used both as a fuel and a reducing agent in smelting iron ore in a blast furnace. Coke has a heating value of 24.8 million Btu per short ton.

Coke Plants: Plants where coal is carbonized in slot or beehive ovens for the manufacture of coke.

Continuous Mining: A form of room-and-pillar mining in which a continuous mining machine extracts and removes coal from the working face in one operation; no blasting is required.

Conventional Mining: The oldest form of room-and-pillar mining which consists of a series of operations that involve cutting the coalbed so it breaks easily when blasted with explosives or high-pressure air, and then loading the broken coal.

Cost, Insurance, Freight (CIF): A type of sale in which the buyer of the product agrees to pay a unit price that includes the f.o.b. value of the product at the point of origin plus all costs of insurance and transportation. This type of transaction differs from a "delivered" purchase in that the buyer accepts the quantity as determined at the loading port (as certified by the Bill of Lading and Quality Report) rather than pay on the basis of the quantity and quality ascertained at the un-

loading port. It is similar to the terms of an f.o.b. sale, except that the seller, as a service for which he is compensated, arranges for transportation and insurance.

Crude Oil: A mixture of hydrocarbons that exists in liquid phase in underground reservoirs and remains liquid at atmospheric pressure after passing through surface-separating facilities. Included are lease condensate and liquid hydrocarbons produced from tar sands, gilsonite and oil shale. Drip gases are also included, but topped crude (residual oil) and other unfinished oils are excluded. Liquids produced at natural gas processing plants and mixed with crude oil are likewise excluded where identifiable. Crude oil is considered as either domestic or foreign, according to the following:

Domestic. Crude oil produced in the United States or from its "outer continental shelf" as defined in 43 U.S.C. 1331.

Foreign. Crude oil produced outside the United States. Imported Athabasca hydrocarbons are included.

Culm: Waste from Pennsylvania anthracite preparation plants, consisting of coarse rock fragments containing as much as 30 percent small-sized coal; sometimes defined as including very fine coal particles called silt. Its heat value ranges from 8 to 17 million Btu per short ton.

Customs District: Customs districts, as defined by the Bureau of the Census, U.S. Department of Commerce, "Monthly Report EM 545," are as follows:

Eastern: Bridgeport, CT, Washington, DC, Boston, MA, Baltimore, MD, Portland, ME, Buffalo, NY, New York City, NY, Ogdensburg, NY, Philadelphia, PA, Providence, RI, Norfolk, VA, St. Albans, VT.

Southern: Mobile, AL, Savannah, GA, Miami, FL, Tampa, FL, New Orleans, LA, Wilmington, NC, San Juan, PR, Charleston, SC, Dallas-Fort Worth, TX, El Paso, TX, Houston-Galveston, TX, Laredo, TX, Virgin Islands.

Western: Anchorage, AK, Nogales, AZ, Los Angeles, CA, San Diego, CA, San Francisco, CA, Honolulu, HI, Great Falls, MT, Portland, OR, Seattle, WA.

Northern: Chicago, IL, Detroit, MI, Duluth, MN, Minneapolis, MN, St. Louis, MO, Pembina, ND, Cleveland, OH, Milwaukee, WI.

Demonstrated Reserve Base: A collective term for the sum of coal in both measured and indicated resource categories of reliability which represents 100 percent of the coal in these categories in place as of a certain date. Includes beds of bituminous coal and anthracite 28 inches or more thick and beds of subbituminous coal 60 inches or more thick that occur at depths to 1,000 feet. Includes beds of lignite 60 inches or more thick that can be surface mined. Includes also thinner

and/or deeper beds that presently are being mined or for which there is evidence that they could be mined commercially at this time. Represents that portion of the identified coal resource from which reserves are calculated.

Depletion: The subtraction of both the tonnage produced and the tonnage lost to mining from identified resources to determine the remaining tonnage as of a certain time.

Depletion Factor: The multiplier applied to the tonnage produced to compute depletion. This multiplier takes into account both the tonnage recovered and the tonnage lost due to mining. The depletion factor is the reciprocal of the recovery factor in relation to a given quantity of production.

Direct Labor Hours: Direct labor hours worked by all mining employees at a mining operation during the year. Includes hours worked by those employees engaged in production, preparation, development, maintenance, repair, shop or yard work, management, and technical or engineering work. Excludes office workers. Excludes vacation and leave hours.

Distillate Fuel Oil: A general classification for one of the petroleum fractions produced in conventional distillation operations. Included are products known as No.1, No.2, and No.4 fuel oils and No.1, No.2, and No.4 diesel fuels. It is used primarily for space heating, on-and-off-highway diesel engine fuel (including railroad engine fuel and fuel for agricultural machinery), and electric power generation.

Dredge Mining: A method of recovering coal from rivers or streams.

Drift Mine: An underground mine that has a horizontal entry dug to a coalbed in a hillside.

Dry (Coal) Basis: Coal quality data calculated to a theoretical basis in which no moisture is associated with the sample. This basis is determined by measuring the weight loss of a sample when its inherent moisture is driven off under controlled conditions of low temperature air-drying followed by heating to just above the boiling point of water (104 to 110 degrees centigrade).

Electricity: A form of energy generated by friction, induction, or chemical change that is caused by the presence and motion of elementary charged particles of which matter consists.

Electricity Generation: The process of producing electric energy or transforming other forms of energy into electric energy. Also the amount of electric energy produced or expressed in watthours (Wh).

Electricity Generation, Gross: The total amount of electric energy produced by the generating station or stations, measured at the generator terminals.

Electricity Generation, Net: Gross generation less electricity consumed at the generating plant for station use. Electricity required for pumping at pumped-storage plants is regarded as plant use and is deducted from gross generation.

Electric Power Plant: A station containing prime movers, electric generators, and auxiliary equipment for converting mechanical, chemical, and/or fission energy into electric energy.

Electric Utility: A corporation, person, agency, authority, or other legal entity or instrumentality that owns and/or operates facilities within the United States, its territories or Puerto Rico for the generation, transmission, distribution, or sale of electric energy primarily for use by the public and files forms listed in the Code of Federal Regulations, Title 18, Part 141. Facilities that qualify as cogenerators or small power producers under the Public Utility Regulatory Policies Act (PURPA) and exempt wholesale generators under Energy Policy Act of 1992 are not considered electric utilities. See definition of nonutility power producer.

Electric Utility Sector: The electric utility sector consists of privately and publicly owned establishments that generate, transmit, distribute, or sell electricity primarily for use by the public and that meet the definition of an electric utility. Nonutility power producers are not included in the electric utility sector.

Emissions: The pollutants discharged into the atmosphere in exhaust gases. For coal-burning plants, these emissions are primarily Carbon Dioxide (CO_2), Nitrogen Oxide (NO_x), and Sulfur Dioxide (SO_2).

Energy: The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic energy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatthours, while heat energy is usually measured in British thermal units.

Energy Consumption: The use of energy as a source of heat or power or as an input in the manufacturing process.

Exports: Shipments of goods from the 50 States and the District of Columbia to foreign countries, Puerto Rico, the Virgin Islands, and other U.S. possessions and territories.

Fahrenheit: A temperature scale on which the boiling point of water is at 212 degrees above zero on the scale and the freezing point is at 32 degrees above zero at standard atmospheric pressure.

F.A.S. Value: Free alongside ship value. The value of a commodity at the port of exportation, generally including the purchase price plus all charges incurred in placing the commodity alongside the carrier at the port of exportation in the country of exportation.

Federal Energy Regulatory Commission (FERC): A quasi-independent regulatory agency within the Department of Energy having jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification.

Federal Coal Lease: A lease granted to a mining company to produce coal from land owned and administered by the Federal Government in exchange for royalties and other revenues.

Federal Power Act: Enacted in 1920, and amended in 1935, the Act consists of three parts. The first part incorporated the Federal Water Power Act administered by the former Federal Power Commission, whose activities were confined almost entirely to licensing non-Federal hydroelectric projects. Parts II and III were added with the passage of the Public Utility Act. These parts extended the Act's jurisdiction to include regulating the interstate transmission of electrical energy and rates for its sale as wholesale in interstate commerce. The Federal Energy Regulatory Commission is now charged with the administration of this law.

Federal Power Commission: The predecessor agency of the Federal Energy Regulatory Commission. The Federal Power Commission (FPC) was created by an Act of Congress under the Federal Water Power Act on June 10, 1920. It was charged originally with regulating the electric power and natural gas industries. The FPC was abolished on September 20, 1977, when the Department of Energy was created. The functions of the FPC were divided between the Department of Energy and the Federal Energy Regulatory Commission.

FERC: The Federal Energy Regulatory Commission.

Fixed Carbon: The nonvolatile matter in coal minus the ash. Fixed carbon is the solid residue other than ash obtained by prescribed methods of destructive distillation of a coal. Fixed carbon is the part of the total carbon that remains when coal is heated in a closed vessel until all volatile matter is driven off.

Flue Gas Desulfurization Unit (Scrubber): Equipment used to remove sulfur oxides from the combustion gases of a boiler plant before discharge to the atmosphere. Chemicals, such as lime, are used as the scrubbing media.

Flue Gas Particulate Collectors: Equipment used to remove fly ash from the combustion gases of a boiler plant before discharge to the atmosphere. Particulate collectors include electrostatic precipitators, mechan-

ical collectors (cyclones), fabric filters (baghouses), and wet scrubbers.

F.O.B. Mine Price: The free on board mine price. This is the price paid for coal at the mining operation site. It excludes freight or shipping and insurance costs.

Foreign-Controlled Firms: Foreign-controlled firms are U.S. coal producers with more than 50 percent of their stock or assets owned by a foreign firm.

Fossil-Fuel Electric Generation: Electric generation in which the prime mover is a turbine rotated by high-pressure steam produced in a boiler by heat from burning fossil fuels.

Geothermal Energy: Energy from the internal heat of the Earth, which may be residual heat, friction heat, or a result of radioactive decay. The heat is found in rocks and fluids at various depths and can be extracted by drilling and/or pumping.

Greenhouse Effect: The increasing mean global surface temperature of the earth caused by gases in the atmosphere (including carbon dioxide, methane, nitrous oxide, ozone, and chlorofluorocarbon). The greenhouse effect allows solar radiation to penetrate but absorbs the infrared radiation returning to space.

Gross Domestic Product (GDP): The total value of goods and services produced by labor and property in the United States. As long as the labor and property are located in the United States, the supplier (that is, the workers and, for property, the owners) may be either U.S. residents or residents of foreign countries.

Gross Domestic Product (GDP) Implicit Price Deflator: The implicit price deflator, published by the U.S. Department of Commerce, Bureau of Economic Analysis, is used to convert nominal figures to real figures.

Hand Loading: An underground loading method by which coal is removed from the working face by manual labor through the use of a shovel for conveyance to the surface. Though rapidly disappearing, it is still used in very small-tonnage mines.

High-Volatile A Bituminous Coal: See Bituminous coal.

High-Volatile B Bituminous Coal: See Bituminous coal.

High-Volatile C Bituminous Coal: See Bituminous coal.

High-Volatile (specific sub-group unknown): See Bituminous coal.

Hydroelectric Power: The harnessing of flowing water to produce mechanical or electrical energy.

Imports: Receipts of goods into the 50 States and the District of Columbia from foreign countries and from

Puerto Rico, the Virgin Islands, and other U.S. possessions and territories.

Indian Coal Lease: A lease granted to a mining company to produce coal from Indian lands in exchange for royalties and other revenues; obtained by direct negotiation with the Indians, but subject to approval and administration by the U.S. Department of the Interior.

Industrial Sector: The industrial sector comprises manufacturing industries which make up the largest part of the sector, along with mining, construction, agriculture, fisheries, and forestry. Establishments in the sector range from steel mills, to small farms, to companies assembling electronic components. The SIC codes used to classify establishments as industrial are 1 through 39.

Interquartile Range: The interquartile range is the range within which the middle 50 percent of observations are concentrated. See Appendix D, Section "Interquartile Range".

Jet Fuel: The term includes kerosene-type jet fuel and naphtha-type jet fuel. Kerosene-type jet fuel is a kerosene-quality product used primarily for commercial turbojet and turboprop aircraft engines. Naphtha-type jet fuel is a fuel in the heavy naphthas range used primarily for military turbojet and turboprop aircraft engines.

Lease Condensate: A natural gas liquid recovered from gas well gas (associated and non-associated) in lease separators or natural gas field facilities. Lease condensate consists primarily of pentanes and heavier hydrocarbons.

Lignite: A brownish-black coal of low rank with high inherent moisture and volatile matter (used almost exclusively for electric power generation). Similar coal in Europe and Australia are also referred to as brown coal. Comprises two groups classified according to the following ASTM Specification D-388-91a for calorific values on a moist mineral-matter-free basis:

	Limits Btu/lb.	
	GE	LT
Lignite A	6300	8300
Lignite B	-	6300

GE = Greater than or equal to
LT = Less than

Lignite is non-agglomerating.

Lignite A: See Lignite.

Lignite B: See Lignite.

Longwall Mining: A form of underground coal mining which is gaining in importance in the United States and can be used at greater depths than room-and-pillar mining. In longwall mining, a cutting machine is pulled back and forth across a panel of coal 300 to 600 feet wide and as much as a mile long, with the broken coal moved by conveyor. Longwall mining is done under movable roof supports that are advanced as the bed is cut. The roof in the mined-out area is allowed to fall as the mining advances.

Low-Volatile Bituminous Coal: See Bituminous coal.

Major Coal Producing States: Any State that produces more than 12 million short tons of coal during the year.

Manufacturing (except coke plants): Those industrial users/plants, not including coke plants, that are engaged in the mechanical or chemical transformation of materials or substances into new (i.e., finished or semi-finished) products. Includes coal used for gasification/liquifaction.

Medium-Volatile Bituminous Coal: See Bituminous Coal.

Merchant Coke Plant: A coke plant where coke is produced primarily for sale on the commercial (open) market.

Meta-Anthracite: See Anthracite.

Metallurgical Coal: Coal that meets the requirements for making coke. It must be low in ash and sulfur and form a coke that is capable of supporting the charge of iron ore and limestone in a blast furnace. A blend of two or more bituminous coals is usually required to make coke.

Metric Ton: A unit of weight equal to 2,204.6 pounds.

Mine Type: See Surface Mine and Underground Mine.

Mineral-Matter-Free Basis: Mineral matter in coal is the parent material in coal from which ash is derived, and which comes from minerals present in the original plant materials that formed the coal, or from extraneous sources such as sediments and precipitates from mineralized water is called the mineral matter. Mineral matter in coal cannot be analytically determined and is commonly calculated using data on ash and ash-forming constituents. Coal analyses are calculated to the mineral-matter-free basis by adjusting formulas used in calculations in order to deduct the weight of mineral matter from the total coal.

Moist (Coal) Basis: "Moist" coal contains its natural inherent or bed moisture, but does not include water adhering to the surface. Coal analyses expressed on a

moist basis are performed or adjusted so as to describe the data when the coal contains only that moisture which exists in the bed in its natural state of deposition, and when the coal has not lost any moisture due to drying.

Naphtha: A genetic term applied to a petroleum fraction with an approximate boiling range between 122 and 400 degrees fahrenheit.

Natural Gas: A mixture of hydrocarbons and small quantities of various nonhydrocarbons existing in the gaseous phase or in solution with crude oil in underground reservoirs.

Natural Gas (Dry): The marketable portion of natural gas production, which is obtained by subtracting extraction losses, including natural gas liquids removed at natural gas processing plants, from total production.

Natural Gas Plant Liquids (NGPL): Natural gas liquids recovered from natural gas in processing plants and, in some situations, from natural gas field facilities, as well as those extracted by fractionators. Natural gas plant liquids are defined according to the published specifications of the Gas Processors Association and the American Society for Testing and Materials as follows: ethane, propane, normal butane, isobutane, pentanes plus, and other products from natural gas processing plants (i.e., products meeting the standards for finished petroleum products produced at natural gas processing plants, such as finished motor gasoline, finished aviation gasoline, special naphthas, kerosene, distillate fuel oil, and miscellaneous products).

Nitrogen Oxide: NO_x . A gas formed in high-temperature environments when nitrogen and oxygen are present together. This typically occurs in a combustion chamber such as those in fossil-fuel burning electric utilities. Nitrogen oxide emissions are a contributor to acid rain.

Nominal Price: The price paid for a product or service at the time of the transaction. The nominal price, which is expressed in current dollars, is not adjusted to remove the effect of changes in the purchasing power of the dollar.

Nonutility Power Producers: A corporation, person, agency, authority, or other legal entity or instrumentality that owns electric generating capacity and is not an electric utility. Nonutility power producers include qualifying cogenerators, qualifying small-power producers, and other nonutility generators (including independent power producers) without a designated franchised service area and which do not file forms listed in the Code of Federal Regulations, Title 18, Part 141. (See Electric Utility.)

Nuclear Electric Power: Electricity generated by an electric power plant whose turbines are driven by

steam generated in a reactor by heat from the fissioning of nuclear fuel.

Number of Mines: The number of mines, or mines collocated with preparation plants or tipples, located in a particular geographic area (State or region). If a mine is mining coal across two counties within a State, or across two States, then it is counted as two operations. This is done so that EIA can separate production by State and county.

Number of Mining Operations: The number of mining operations includes preparation plants with greater than 5,000 total direct labor hours. Mining operations that consist of a mine and preparation plant or a preparation plant only will be counted as two operations, if the preparation plant processes both underground and surface coal. Excluded are silt, culm, refuse bank, slurry dam, and dredge operations except for Pennsylvania anthracite. Excludes mines producing less than 10,000 short tons of coal during the year, and preparation plants with less than 5,000 employee hours.

Open Market Coal: Coal sold in the open market, i.e., coal sold to companies other than the reporting company's parent company or an operating subsidiary of the parent company.

Operating Subsidiary: A company which is controlled through the ownership of voting stock, or a corporate joint venture in which a corporation is owned by a small group of businesses as a separate and specific business or project for the mutual benefit of the members of the group.

Other Industrial Plant: Industrial users, not including coke plants, engaged in the mechanical or chemical transformation of materials or substances into new products (manufacturing); and companies engaged in the agriculture, mining, or construction industries.

Other Unions: See Union Type.

Overburden: Any material, consolidated or unconsolidated, that overlies a coal deposit.

Parent Company: A company which solely or jointly owns the reporting company and which is not itself a subsidiary of, or owned by, another company.

Percent Utilization: The ratio of total production to productive capacity, times 100.

Petroleum: Petroleum includes residential and distillate fuel oils, crude oil, and all other petroleum fuels, excluding petroleum coke.

Petroleum Coke: A residue that is the final product of the condensation process in cracking. The product is either marketable petroleum coke or catalyst petroleum coke.

Petroleum Products: Products obtained from the processing of crude oil (including lease condensate), natural gas, and other hydrocarbon compounds. Petroleum products include unfinished oils, liquefied petroleum gases, pentanes plus, aviation gasoline, motor gasoline, naphtha-type jet fuel, kerosene-type jet fuel, kerosene, distillate fuel oil, residual fuel oil, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt, road oil, still gas, and miscellaneous products.

Photovoltaic and Solar Thermal Energy (as used at electric utilities): Energy radiated by the sun as electromagnetic waves (electromagnetic radiation) that is converted at electric utilities into electricity by means of solar (photovoltaic) cells or concentrating (focusing) collectors.

Preparation Plant: A mining facility at which coal is crushed, screened, and mechanically cleaned.

Producer and Distributor Coal Stocks: Producer and distributor coal stocks consist of coal held in stock by producers/distributors at the end of a reporting period.

Productive Capacity: The maximum amount of coal that a mining operation can produce or process during a period with the existing mining equipment and/or preparation plant in place, assuming that the labor and materials sufficient to utilize the plant and equipment are available, and that the market exists for the maximum production.

Quadrillion Btu: 10^{15} Btu.

Real Price: A price that has been adjusted to remove the effect of changes in the purchasing power of the dollar. Real prices, which are expressed in constant dollars, usually reflect buying power relative to a base year.

Recoverable Coal Reserves at Mines: The quantity of coal that can be recovered (i.e. mined) from existing coal reserves, as reported on Form EIA-7A.

Recoverable Reserves of Coal: An estimate of the amount of coal that can be recovered (mined) from the accessible reserves of the demonstrated reserve base.

Recovery Percentage: The percentage of coal that can be recovered from the coal deposits at existing mines.

Refuse Bank: A repository for waste material generated by the coal cleaning process.

Refuse Mine: A surface mine where coal is recovered from previously mined coal. It may also be known as a silt bank, culm bank, refuse bank, slurry dam, or dredge operation.

Report Year: The calendar year beginning at 12:00 a.m. January 1 and ending at 11:59 p.m. December 31.

Residential and Commercial Sector: Housing units; wholesale and retail businesses (except coal deposits at active, producing mines as of the end of the year, as reported on Form EIA-7A. wholesale dealers); health institutions (hospitals); social and educational institutions (schools and universities); and Federal, State, and local governments (military installations, prisons, office buildings).

Residual Fuel Oil: The heavier oils that remain after the distillate fuel oils and lighter hydrocarbons are distilled away in refinery operations and that conform to ASTM Specifications D396 and 975. Included are No. 5, a residual fuel oil of medium viscosity; Navy Special, for use in steam-powered vessels in government service and in shore power plants; and No. 6, which includes Bunker C fuel oil and is used for commercial and industrial heating, electricity generation, and to power ships. Imports of residual fuel oil include imported crude oil burned as fuel.

Room-and-Pillar Mining: The most common method of underground mining in which the mine roof is supported mainly by coal pillars left at regular intervals. Rooms are places where the coal is mined; pillars are areas of coal left between the rooms. Room-and-pillar mining is done either by conventional or continuous mining.

Royalties: Payments, in money or kind, of a stated share of production from mineral deposits, by the lessee to the lessor. Royalties may be an established minimum, a sliding-scale, or a step-scale. A step-scale royalty rate increases by steps as the average production on the lease increases. A sliding-scale royalty rate is based on average production and applies to all production from the lease.

Sales Volume: The reported output from Federal and/or Indian lands, the basis of royalties. It is approximately equivalent to production, which includes coal sold, and coal added to stockpiles.

Scoop Loading: An underground loading method by which coal is removed from the working face by a tractor unit equipped with a hydraulically operated bucket attached to the front; also called a front-end loader.

Semianthracite: See Anthracite.

Shaft Mine: An underground mine that reaches the coalbed by means of a vertical shaft. In addition to the passages providing entry to the coalbed, a network of other passages are also dug, some to provide access to various parts of the mine and some for ventilation.

Short Ton: A unit of weight equal to 2 thousand pounds.

Shortwall Mining: A form of underground mining that involves the use of a continuous mining machine and movable roof supports to shear coal panels 150 to 200 feet wide and more than half a mile long. Although similar to longwall mining, shortwall mining is generally more flexible because of the smaller working area. Productivity is lower than with longwall mining because the coal is hauled to the mine face by shuttle cars as opposed to conveyors.

SIC: See Standard Industrial Classification.

Silt: Waste from Pennsylvania anthracite preparation plants, consisting of coarse rock fragments containing as much as 30 percent small-sized coal; sometimes defined as including very fine coal particles called silt. Its heat value ranges from 8 to 17 million Btu per short ton. Synonymous with culm.

Silt, Culm Refuse Bank, or Slurry Dam Mining: A mining operation producing coal from these sources of coal. (see refuse mine.)

Slope Mine: An underground mine in which the entry is driven at an angle to reach the coal deposit.

Slurry Dam: A repository for the silt or culm from a preparation plant.

Solar Energy: The radiant energy of the sun, which can be converted into other forms of energy, such as heat or electricity.

Solar Thermal Collector: A device designed to receive solar radiation and convert it into thermal energy. Normally, a solar thermal collector includes a frame, glazing, and an absorber, together with appropriate insulation. The heat collected by the solar thermal collector may be used immediately or stored for later use.

Standard Industrial Classification (SIC): A set of codes developed by the Office of Management and Budget which categorizes industries to groups with similar economic activities.

Steam Coal: All noncoking coal.

Stocks: The supply of coal or coke at a mine, plant, or utility at the end of the reporting period.

Strategic Petroleum Reserve (SPR): Petroleum stocks maintained by the Federal Government for use during periods of major supply interruption.

Strip (Surface) Mining: A method used on flat terrain to recover coal by mining long strips successively. The material excavated from the strip being mined is deposited in the strip previously mined.

Subbituminous Coal: A dull black coal of rank intermediate between lignite and bituminous, consisting of

subbituminous A coal, subbituminous B coal, and subbituminous C coal, classified according to the following ASTM Specification D-388-91a on a moist mineral-matter-free basis:

	Calorific Value Limits Btu/lb.	
	GE	LT
Subbituminous A Coal	10500	11500
Subbituminous B Coal	9500	10500
Subbituminous C Coal	8300	9500

GE = Greater than or equal to
LT = Less than

Subbituminous coal is non-agglomerating.

Subbituminous A Coal: See Subbituminous Coal.

Subbituminous B Coal: See Subbituminous Coal.

Subbituminous C Coal: See Subbituminous Coal.

Sulfur: One of the elements present in varying quantities in coal that contributes to environmental degradation when coal is burned. In terms of sulfur content by weight, coal is generally classified as low (less than or equal to one percent), medium (greater than one percent and less than or equal to three percent), and high (greater than three percent). Sulfur content is measured as a percent by weight of coal on an "as received" or a "dry" (moisture-free, usually part of a laboratory analysis) basis.

Sulfur Dioxide: SO_2 . A caustic, corrosive gas that is a by-product of combustion and emissions from fossil-fuel burning electric utility plants. The primary agent in the production of acid rain.

Supplemental Gaseous Fuels: Any gaseous substance that, introduced into or commingled with natural gas, increases the volume available for disposition. Such substances include, but are not limited to, propane-air, refinery gas, coke oven gas, still gas, manufactured gas, biomass gas, or air or inert gases added for Btu stabilization.

Surface Mine: A coal-producing mine that is usually within a few hundred feet of the surface. Earth and rock above or around the coal (overburden) is removed to expose the coalbed, which is then mined with surface excavation equipment such as draglines, power shovels, bulldozers, loaders, and augers. It may also be known as an area, contour, open-pit, strip, or auger mine.

Tipple: A central facility used in loading coal for transportation by rail or truck.

Transportation Sector: The transportation sector consists of private and public vehicles that move people and commodities. Included are automobiles, trucks, buses, motorcycles, railroads and railways (including streetcars), aircraft, ships, barges, and natural gas pipelines.

Underground Mine: A mine where coal is produced by tunneling into the earth to the coalbed, which is then mined with underground mining equipment such as cutting machines and continuous, longwall, and shortwall mining machines. Underground mines are classified according to the type of opening used to reach the coal, i.e., drift (level tunnel), slope (inclined tunnel), or shaft (vertical tunnel).

Unfinished Oils: All oils requiring further refinery processing, except those requiring only mechanical blending. Includes naphthas and lighter oils, kerosene and light gas oils, heavy gas oils, and residuum.

Union Type: Union type consists of United Mine Workers of America (UMWA), and the following "Other Union" types: Southern Labor Union (SLU), Appalachian Miners of America (AMA), Scotia Employees Association (SEA), International Union of Operation Engineers (IUOE), Utility Workers of America (UWA), Progressive Mine Workers Association (PMWA), International Brotherhood of Electrical Workers (IBEW), International Chemical Workers Union (ICWU), Redstone Workers Association (RWA), Chariton Valley Independent Union (CVIU), American Federation of Labor - Congress of Industrial Organization (AFL-CIO), Labors International (LABO), Crow Hollow Miners (CROW), Coal Strippers (COAL), United Steel Workers (USW), Independent Miners Association (IMA), Independent Union (INUN), Independence Miners, Brokers, and Truckers Association (IMBT), Council of Southern Mountains (CSM), International Brotherhood of Teamsters, Chauffeurs, Warehousemen and Helpers Union (TEAM), Thompson Creek Workers Association (TCWA), United Brotherhood of Clay Workers (UBCW), Wilmot Employees Independent Union (WEIU), Independent Strip Miners Union (ISMU), Independent Miners (IM), Independent Workers (IW), Coal Strippers Union (CSU), Independent Miners Union (IMU), Independent Coal Workers (ICW), Independent Strip Mining Workers (ISMW), Independent Strip Union (ISU), Association of Bituminous Contractors (ABC), Arch Minerals Employees Association (AMEA), United Paperworkers International Union (UPIU), Welch Miners Union (WMU), Falcon Coal Employees Association (FCEA), Justus Employees Association (JEA), International Construction Union (ICU), Brotherhood of Miners (BOM), Western Energy Workers (WEW), Carlin Independent Union (CIU), International Association of United Workers Union (IAWU), and Stove, Furnace and Allied Appliance Workers International Union of N. A. (SFAW).

U.S. Coal Exports: Amount of U.S. coal shipped to foreign destinations, as reported in the U.S. Department of Commerce, Bureau of Census, "Monthly Report EM 545".

U.S. Coal Imports: Amount of foreign coal shipped to the United States, as reported in the U.S. Department of Commerce, Bureau of the Census, "Monthly Report IM 145".

Wind Energy (as used at electric utilities): The kinetic energy of wind converted at electric utilities into mechanical energy by wind turbines (i.e., blades rotating

from the hub) that drive generators to produce electricity for distribution.

Wood and Waste (as used at electric utilities): Wood energy, garbage, bagasse, sewerage gas, and other industrial, agricultural, and urban refuse used to generate electricity for distribution.

Volatile Matter: Those products, exclusive of moisture, given off by a material as gas or vapor. Volatile matter is determined by heating the coal to 950 degrees centigrade under carefully controlled conditions and measuring the weight loss, excluding weight of moisture driven off at 105 degrees centigrade.
