ACKNOWLEDGMENTS

The authors are especially indebted to R. Q. Wright for his patient efforts in processing the trial group structures leading up to the adoption of the 37-21 structure, and for processing the initial library. The authors are also indebted to W. E. Ford, III, to D. M. Plaster, and to C. C. Webster for generating subsequent cross-section sets. Special thanks is due to N. M. Greene for his assistance in debugging the cross-section sets and for his contribution of the ARID module. The project itself is the result of the foresight and planning of F. R. Mynatt of ORNL and D. Kaul of SAI, formerly Project Officer at DNA. The existence of this manual is due to the organizational skills and typing of G. B. Raiford, which is deeply appreciated.

ABSTRACT

A state-of-the-art cross-section library has been developed for the Defense Nuclear Agency in a 37-21 neutron-gamma energy group structure that can be used for radiation transport calculations on most available computer facilities. Based on data from the DNA Working Cross Section Library and the Evaluated Nuclear Data File, the library contains cross sections for 35 nuclides that will be updated and added to regularly. The documentation presented here includes descriptions of typical sources and responses in the 37-21 structure and results of comparative calculations performed for testing purposes. The library is available through the Radiation Shielding Information Center at Oak Ridge National Laboratory.

I. INTRODUCTION

Many contractors performing radiation transport calculations for the Defense Nuclear Agency do not have access to the large computer facilities required to use the detailed sets of coupled neutron and gamma-ray interaction cross sections developed by the several shielding research organizations. To aid their contractors, DNA requested that ORNL develop and test a coupled cross-section library having the minimum number of neutron and gamma-ray energy groups to obtain acceptable accuracy in the transport results. The resulting library, processed with the AMPX code,¹ contains 37 neutron groups and 21 gamma-ray groups and includes cross sections for 35 nuclides of specific interest to the defense community. The library is based on cross-section data from the DNA Working Cross Section Library (DNA WCSL)* and the Evaluated Nuclear Data File.² As new data become available from these two sources, the library will be subject to regular maintenance and revision and thereby will represent the state of the art.

This report presents the documentation of the library. Section II gives a listing of the contents of the library in terms of nuclides, with appropriate references. It also presents the energy group structure, along with details regarding the processing employed.

Section III contains a listing of the response functions included in the library and a discussion of their application, together with descriptions of frequently employed source distributions. Calculations performed to test the library by comparison with other libraries are described in

*R. W. Roussin, "The Defense Nuclear Agency Working Cross Section Library: Description and Contents," ORNL-RSIC-34 (1972) Revised 1973. This document is periodically revised to reflect changes in the DNA WCSL, but a more timely status is given by means of the RSIC Monthly Newsletter.

Section IV. Complete problem descriptions are given, as well as the results obtained and conclusions drawn, particularly with regard to group structure and weighting functions.

Appendix A contains a listing of the partial reaction cross sections (for example, elastic, inelastic, etc.) by element, and describes a simple module for collapsing the 37-21 neutron-gamma group library to fewer energy groups, as in a 22-18 neutron-gamma structure.

Inquiries or requests for the library package may be mailed to:

Data Coordinator
Radiation Shielding Information Center (RSIC)
Oak Ridge National Laboratory
Post Office Box X
Oak Ridge, Tennessee 37830.

The library is designated DLC-31/(DPL-1/FEWG1) by RSIC.

II. LIBRARY CONTENTS

A list of the 35 nuclides included in this cross-section library is presented in Table 1, along with the names of the evaluators, the date of the evaluation, and the data set identification in the DNA Working Cross Section Library and/or Evaluated Nuclear Data File (ENDF/B).

As stated previously, the cross sections were processed into a coupled 37-21 neutron-gamma energy group structure, with gamma-ray production included for each element. The energy structure, shown in Table 2, is quite biased at high energies for both the neutron and the gamma-ray groups owing to the importance of high-energy particles for the calculation of tissue dose and silicon damage in electronics.³ In addition, the neutron groups are tailored to allow for the major peaks and valleys in the total neutron cross sections of nitrogen, oxygen, silicon, and iron, and the gamma-ray groups are tailored to allow

accurate calculation of pair production, annihilation photon transport, hydrogen capture, and backscatter photon transport. There is also sufficient low photon energy structure to allow for rapidly changing cross sections and response functions. The cross-section data were processed with the AMPX¹ code, using a $1/E$ weighting spectrum for all neutron groups except the thermal group, for which a 300°K Maxwellian weighting spectrum was used. A P_3 Legendre expansion is given for each element in the ANISN⁴ format, as follows:

For Energy Group g

<u>Table Position</u>		<u>Cross Section</u>
1	σ_a	absorption
2	$\nu\sigma_f$	fission
3	σ_T	total
4	σ_{gg}	scatter within group g
5	$\sigma_{g-1 \rightarrow g}$	downscatter into group g
.	$\sigma_{g-2 \rightarrow g}$	scatter from groups $g-1$, $g-2$, etc. to group g
.	.	.
.	.	.
.	.	.
.	$\sigma_{1 \rightarrow g}$	downscatter from group 1 to g
.	.	.
.	0	.
.	.	.
61	0	.

The table length of the cross-section set is therefore 61 to allow for downscatter and production from all higher groups to group 58 (gamma-ray group 21), and the cross sections basically fill in the upper diagonal matrix below the first three positions.

III. SOURCES AND RESPONSES

This section presents the sources and response functions included with the library for use in defense-related calculations. The titles of the response functions are listed in Table 3, along with the applicable units. Responses 1 and 2, the neutron and gamma free-in-air tissue kerma response functions, were generated for an 11-element standard man⁵ composition from the same data used for the cross-section library with the MACK⁶ code. Free-in-air tissue kerma is also referred to as a single-collision or first-collision dose. Responses 3, 4, and 5 are essentially electronic damage functions. Responses 6 and 7 are neutron and gamma tissue dose responses, respectively. These tissue dose responses were obtained by transporting monoenergetic neutron and gamma broad-beam sources through tissue phantoms and scoring the maximum energy deposition (kerma) in the phantoms. Response 6, the Snyder-Auxier neutron tissue dose function,⁷ considered a three-dimensional homogeneous cylindrical tissue phantom and includes the effects of secondary gammas produced in the phantom. Response 7, the Claiborne-Trubey gamma tissue dose function,⁸ considered a one-dimensional homogeneous slab tissue phantom. Table 4 presents the free-in-air kerma functions (responses 1 and 2), the tissue dose (in-phantom) functions (responses 6 and 7), and includes the older Henderson neutron free-in-air kerma function for comparison. The entire set of response functions listed in Table 3 are presented in cross-section format as Appendix B. Responses 8 through 21 and 22 through 35 are neutron and gamma elemental kerma factors, respectively. Kerma is

an acronym for Kinetic Energy Release in Materials. The elemental kerma factors given here must be multiplied by the normal atomic number density (atoms/g/10²⁴) to give calculational units of rads/(neutron/cm²), similar to those given in the tissue kerma responses 1 and 2. The elemental kerma data included here were used in the generation of responses 1 and 2. Response 36 is an older neutron tissue dose function,⁹ while responses 37 and 38 are older free-in-air tissue kerma factors,¹⁰ still frequently employed.

A word of caution should be expressed regarding the use of response 37, since the Henderson neutron tissue kerma has no values below group 27 (10 keV), while the newer kerma have values at all energies and have a fairly significant value at thermal energies. Response 39 is the Snyder-Auxier neutron tissue dose response in units of rem/(neutron/cm²). The data in response 6, the Snyder-Auxier neutron tissue dose in rads/(neutron/cm²), were multiplied by a quality factor which accounts for the difference in linear energy transfer (LET) for neutrons of different energies in order to obtain response 39. The LET quality factors are similar to the relative biological effectiveness (RBE) factors frequently used in radiobiological applications. Selected neutron and gamma sources are given in Table 5 in the 37-21 group structure. These sources are commonly used in defense-related calculations, and some of the neutron sources were utilized in the comparative calculations presented in Section IV.

IV. TESTING

This section presents the results of efforts designed to determine the ability of the 37-21 library to solve problems of basic interest to the defense community. These efforts were specifically directed toward questions concerning the correctness of the basic data, the results of the processing (including effects of the weighting function utilized in collapsing from the basic point data to a few-group library), and the adequacy of the 37 neutron and 21 gamma energy group structures selected. Three basic problems were addressed in the course of this study, two air penetration calculations and a concrete penetration calculation. All three problems were run using the familiar sources and response functions given in Section III and Appendix B.

Table 6 presents the results of an air transport calculation in spherical geometry using an S_{16} angular quadrature. Neutron and gamma tissue doses, neutron displacement in silicon, and neutron and gamma ionization in silicon are given at 2000 m in air due to a thermonuclear source. The calculations were extended to 3000 m to allow for adequate reflection. The results are given in rads or equivalent 1-MeV displacements per incident neutron. This problem was calculated with six different cross-section sets. The 129-neutron 43-gamma cross-section set* with a (1/E) weighting was selected as a standard because energy-group boundaries for this structure were specifically chosen to fit in detail the peaks and valleys in the neutron cross sections and to bracket major gamma-production lines for elements involved in transport through air and concrete. The 129-43 case with $(1/E\Sigma_T)$ weighting indicates the adequacy of this group structure for this problem, since the results agree to within

*See Appendix D.

4%. The 129-42 set indicates the importance ($\sim 15\%$) of including the gammas with energies above 10 MeV, since the 42-group gamma structure cuts off at 10 MeV. The 37-18 ($1/E$) results agree quite well with the 129-43 set and indicate the adequacy of the 37-group neutron structure for this problem. The 37-18 ($1/E\bar{\Sigma}_T$) results, on the other hand, show a fairly large discrepancy, exceeding the arbitrarily selected goal of agreement within 10%. This is believed to be due to an overemphasis on relative minima contained in relatively broad energy groups in the 1.8- to 0.1-MeV range, so that resulting downscatter is too low for the ($1/E\bar{\Sigma}_T$)-weighted case. The 37-21 ($1/E$) results agree very well for the neutron responses and for the gamma tissue dose. The increase in the gamma silicon response is due to the importance of low-energy gammas ($E < 0.10$ MeV) for the silicon ionization response as compared with the Henderson gamma tissue dose response (see Appendix B). The 21-group gamma structure was designed to provide sufficient energy groups for low-energy gamma transport (5 groups below 0.1 MeV) and hence gives an enhanced silicon ionization compared to the 43-group structure.

Table 7 presents the results of a series of calculations for a thermonuclear source spectrum incident on a 40 in. concrete slab. The responses and cross-section sets utilized are very similar to those presented in Table 6, but an S_8 angular quadrature set was employed for the slab geometry. The results here are generally similar to those obtained for the air case. In general, the results were satisfactory (within 10% of the 129-43 ($1/E$) results) for all combinations of weighting functions and group structures employed. The final calculation was

**ENDF/B-IV Si (4151-3) and Fe (4180-2).

added to determine the effect of the new ENDF/B-IV evaluated data and does indicate a significant increase in calculated responses, especially due to the high-energy cross sections for silicon.

Table 8 presents the results of a study of very deep (9000 m) air penetration from 14-MeV and weapon fission sources. Results for the 14-MeV case indicate that both weightings meet the 10% criteria for about 4000 m, and that the 37-21 results are always within a 20% criteria for this problem. These results are quite gratifying, since the uncertainty in the dose due to uncertainties in the basic cross-section data is considerably larger than this discrepancy.² The weapon fission-weighted cross section set displays a definite superiority to the 1/E-weighted set for the weapon fission source within the first 3000 m. The weapon fission-weighted cross sections for nitrogen and oxygen were therefore included in this library for use in similar problems.

A related study to determine P_L (degree of Legendre expansion) requirements for air transport determined that the P_3 expansion was adequate. For example, with a weapon fission source, the resulting Snyder-Auxier neutron dose from a P_3 calculation was within 7% of a similar P_5 calculation out to 9000 m, while the gamma dose was within 13%.

In summary, these results indicate that the 37-21 library is adequate to solve many problems of interest to the defense community. Additional testing of the library continues, and additions and updates will be performed as required.

APPENDIX A

Listing of Partial Cross Sections

This appendix contains partial cross sections listed by nuclide for each cross-section set included in the library. Partial cross sections are included for both neutron and gamma cross sections in a one-dimensional array printed by the AMPX code at the completion of processing the point data into multigroup form. The total cross section for neutrons is the sum of the elastic, inelastic, $(n,2n)$, and absorption cross sections. The constituent partials of the absorption cross section [such as (n,γ) , (n,P) , (n,D) , (n,T) , (n,α) , etc.] are then listed separately. The inelastic cross section includes $(n, n', x\gamma)$ -type reactions. The gamma partials listed are the pair-production and photoelectric cross sections and their sum, printed as the absorption cross section. The Compton scattering cross section is not given here, but may be obtained by subtracting the absorption cross section from the total nuclide cross section. The energy deposition values given here are gamma kerma values in units of $(\text{MeV-barn})/(\text{photon-atom})$, and are consistent with the tissue kerma values in $(\text{rads/atom})/(\text{photon/cm}^2/\text{gram})$ given in Appendix B. No gamma partials are listed for the weapon fission-weighted nitrogen and oxygen cross-section sets, since the gamma transport cross sections are unaffected by the weighting function and are therefore the same as those listed under the $(1/E)$ -weighted nitrogen and oxygen. The partial cross sections listed can be used for analytical purposes or as response functions to determine reaction rates.

APPENDIX B

Listing of Response Functions

This Appendix contains a listing of response functions included with this library as material 1. The responses are given as a function of group number (neutron groups 1 through 37; gamma groups 38 through 58) and as a function of position as follows:

POS 1	N FREE-IN-AIR TIS KER	RADS/(N/CM**2)
POS 2	G FREE-IN-AIR TIS KER	RADS/(G/CM**2)
POS 3	N DISPLACEMENT IN SI	(EQUIV 1MEV N/CM**2)/(N/CM**2)
POS 4	N ION IN SI	(RADS-SI)/(N/CM**2)
POS 5	G ION IN SI	(RADS-SI)/(G/CM**2)
POS 6	SNYDER-AUXIER N TIS DOSE	RADS/(N/CM**2)
POS 7	CLAUERNE-TRUBEY G TIS DOSE	RADS/(G/CM**2)
POS 8	H NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 9	C NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 10	N NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 11	O NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 12	NA NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 13	MG NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 14	AL NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 15	SI NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 16	P NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 17	S NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 18	CL NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 19	K NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 20	CA NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 21	FE NEUTRON KERMA	(RADS/ATOM)/(N/CM**2*G)
POS 22	H GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 23	C GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 24	N GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 25	O GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 26	NA GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 27	MG GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 28	AL GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 29	SI GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 30	P GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 31	S GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 32	CL GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 33	K GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 34	CA GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 35	FE GAMMA KERMA	(RADS/ATOM)/(G/CM**2*G)
POS 36	SNYDER-NEUFELD N TIS DOSE	RADS/(N/CM**2)
POS 37	HENDERSON N FREE-IN-AIR TIS KERMA	RADS/(N/CM**2)
POS 38	HENDERSON G FREE-IN-AIR TIS KERMA	RADS/(G/CM**2)
POS 39	SNYDER-AUXIER N TIS DOSE	REM/(N/CM**2)

APPENDIX C

ARID - A Simple Collapsing Code

A simple collapsing code, ARID, has been developed from the COMAND module of the AMPX processing code to enable collapse of the 37-21 library to smaller group structures. The ARID code is included in the library package, and is tailored to receive the 37-21 energy group structure cross-section sets as input data sets. The user then specifies the final group structure and the collapsing spectrum. A $(1/E)$ to thermal Maxwellian neutron spectrum and a flat gamma spectrum are built into the code, or the user can input an arbitrary weighting spectrum, such as that obtained for a specific calculation with the original 37-21 library. This gives the user the capacity to generate problem-dependent cross-section libraries as desired, or to create smaller problem-independent libraries. The following pages give details on procedures for running ARID and discuss output choices.

ARID

The collapser to go with the DNA Few Group Library is a simplified version of the AMPX COMAND module.

This module, ARID (ANISN Reduction If DNA Few Group Library is Your Base Cross Section Set), assumes the following:

1. An ANISN library in card image or binary format is mounted on logical unit 20. It has the ANISN P_{ℓ} decks stacked with control cards interspersed as if one were getting ready to run ALC1 to make an ANISN library.
2. A collapsed library will be written in ANISN binary format on logical unit 18. These can be punched onto cards in the ANISN free-form BCD format on logical 7.
3. ARID assumes:
 - a. total number of groups on DNA library is 58 (37 neutron and 21 gamma),
 - b. the total cross section is in position 3,
 - c. the within group cross section is in position 4,
 - d. the table length of the DNA library is 61.
4. One can selectively collapse the data over a built-in spectrum, or the user may override the built-in data by inputting his own. The built-in spectrum consists of a $1/E$ variation joined to a thermal Maxwellian (300k) for neutrons and has a flat variation for gamma groups.

The data required are as follows:

1\$\$ Collapsing Case Description

1. IGMF - total number of groups in broad structure.
2. IHTF - position of σ_T in broad structure.
3. IHSF - position of σ_{gg} in broad structure.
4. IHMF - table length in broad structure.
5. IEDIT - 0, almost no edit,
1, edit collapsed data,
2, edit fine group and collapsed data.
6. NSPEC - spectrum number to use in collapsing (input a zero).
7. NPNCH - 0, no punch,
1, punch collapsed cross sections in ANISN free-form
format.
8. NFM - -1, DNA Few Group Library is in ANISN binary format,
0, DNA Few Group Library is in ANISN BCD free-form
format,
1, DNA Few Group Library is in ANISN BCD fixed form
format.

T Terminate Block 1

3 ** Weighting Spectrum (This will override a selected spectrum.)

4 \$\$ Broad Group Numbers by Fine Group

This corresponds to the 28\$ array in ANISN or 51\$ array in XSDRN.

A zero entry will suppress a group.

T Terminate Case Data

Note that one can use ARID to convert ANISN library formats, either BCD to binary or binary to BCD.
