ORNL/NUREG/TM-114

**PWR Blowdown Heat Transfer
Separate-Effects Program—
Thermal-Hydraulic Test Facility
Experimental Data Report for Test 100**

M. D. White
R. A. Hedrick

MASTER

Prepared for the U.S. Nuclear Regulatory Commission
Office of Nuclear Regulatory Research
Under Interagency Agreements ERDA 40-551-75 and 40-552-75

BLANK PAGE

FIGURES	v
ABSTRACT	1
I. INTRODUCTION	1
II. SYSTEM, PROCEDURES, CONDITIONS, AND EVENTS FOR TEST 100	2
1. System Configuration and Test Procedure	2
2. Initial Test Conditions and Sequence of Events	4
III. DATA PRESENTATION	6
 TABLES	
Table 1. Desired vs actual prerulepture conditions	4
Table 2. Prerulepture primary-coolant temperature and pressure distribution	5
Table 3. Sequence of events during test 100	5
Table 4. Precision of experimental measurements for test 100	7
Table 5. Data presentation for test 100	8

FIGURES

PWR BLOWDOWN HEAT TRANSFER SEPARATE-EFFECTS
PROGRAM - THERMAL-HYDRAULIC TEST FACILITY
EXPERIMENTAL DATA REPORT FOR TEST 100

M. D. White R. A. Hedrick

ABSTRACT

Reduced instrument responses are presented for Thermal-Hydraulic Test Facility (THTF) test 100, which is part of the ORNL Pressurized-Water-Reactor (PWR) Blowdown Heat Transfer Separate-Effects Program. The objective of the program is to investigate the thermal-hydraulic phenomenon governing the energy transfer and transport processes that occur during a loss-of-coolant accident in a PWR system.

Test 100 was conducted to investigate the response of heater rod bundle 1 and instrumented spool pieces with flow homogenizing screens to a double-ended rupture with equal break areas at the test section inlet and outlet.

The primary purpose of this report is to make the reduced instrument responses during test 100 available. The responses are presented in graphical form in engineering units and have been analyzed only to the extent necessary to assure reasonableness and consistency.

I. INTRODUCTION

The Oak Ridge National Laboratory Pressurized-Water Reactor (ORNL-PWR) Blowdown Heat Transfer Program is a separate-effects study of the relations among the principal variables that can alter the rate of blowdown, the presence of flow reversal and rereversal, time delay to critical heat flux, the rate at which dryout progresses, and similar time- and space-related functions that are important in loss-of-coolant accident (LOCA) analyses. Primary test results are obtained from the Thermal-Hydraulic Test Facility (THTF), a large nonnuclear pressurized-water loop incorporating a 49-rod electrically heated bundle in 7×7 geometry.

THTF test 100 (conducted Apr. 23, 1976) was the first test conducted in the facility with bundle 1 in place. This test was performed to investigate the response of bundle 1 and instrumented spool pieces with flow homogenizing screens to a double-ended rupture with equal break areas at

the test section inlet and outlet. This was an isothermal test to provide baseline information on the experimental facility response.

The purpose of this report is to provide the reduced instrument responses during test 100 in a readily usable form to the nuclear community in advance of detailed analyses and interpretations. These data are presented on microfiche attached to the back cover of the report. Final analyses and interpretations are scheduled for publication six months after the completion of test series 100. The program and the experimental facilities are described in Ref. 1.

II. SYSTEM, PROCEDURES, CONDITIONS, AND EVENTS FOR TEST 100

1. System Configuration and Test Procedures

The Thermal-Hydraulic Test Facility (THTF), shown in Fig. 1, consists of a test section with a 49-rod, 3.66-m-long (12-ft) electrically heated core; a circulation loop comprised of three parallel heat exchangers with bypass, a pressurizer, a pump with bypass, and associated control valves; two rupture assemblies; and a pressure-suppression system. For test 100 a total break area of 12.54 cm^2 (0.0135 ft^2) was divided equally between the test section inlet and outlet rupture assemblies. The THTF experimental system is described further in Ref. 1.

Since test 100 was an isothermal test, no power was applied to the electric core. The main heat exchangers were drained, and the drains and vents were left open.

In preparation for the test, the loop was filled with demineralized water and the system pressure checked. Instrumentation and data acquisition checks were performed. During the warmup, data were taken for use in flow and pressure calibrations.

During the test, the THTF was successfully subjected to a double-ended pipe break through the two rupture assemblies containing the orifice

1. *Project Description: ORNL PWR Blowdown Heat Transfer Separate-Effects Program - Thermal-Hydraulic Test Facility (THTF)*, ORNL/NUREG/TM-2 (February 1976).

Fig. 1. Thermal-Hydraulic Test Facility (THTF).

plates. The effluent from the primary system was ejected into the pressure-suppression system, which was maintained at atmospheric pressure. The primary-coolant pump was tripped coincident with break initiation.

2. Initial Test Conditions and Sequence of Events

The THTF conditions immediately preceding rupture are given in Tables 1 and 2. The sequence of events relative to the rupture is given in Table 3.

Table 1. Desired vs actual prerupture conditions

Parameters	Instrument	Desired ^a	Actual ^b

Heat exchanger inlet header	PE-44		15.430 (2235)
Mixed mean temperature			
Downstream heat exchangers	TE-28B	561.5 (551)	
Pressurizer surge line	TE-2	612.0 (642)	
Pressurizer	PE-106		14.851 (2154)
Primary pump suction	PE-76		14.920 (2164)
Between main control valves HCV-2 and FCV-19	TE-4B	557.6 (544)	
Between main control valves HCV-2 and FCV-18	PE-16		17.361 (2518)

^aPrerupture distribution is based on instrument signals recorded within 10 sec of primary system rupture.

Table 3. Sequence of events during test 100^a

Event	Time relative to rupture (sec)
Core power level established	N.A.
Core temperature rise established	N.A.
Analog tapes and CCDAS fast scan started	-15
Blowdown initiated	0
Pump power tripped	0
Heat exchanger secondary valves closed	N.A.
Core power tripped	N.A.

^aN.A. = not applicable.

III. DATA PRESENTATION

The recorded instrument responses for THTF test 100 have been processed only to the extent necessary to obtain appropriate engineering units and to assure reasonableness and consistency. In converting instrument responses to engineering units, a homogeneous fluid has been assumed. Therefore, interpretation or analysis of the data must consider the fact that the instruments may have been subjected to nonhomogeneous fluid conditions during the transient.

The reduced instrument responses presented in this report were recorded by a computer-controlled digital data acquisition system (DAS). Further information on this system may be found in Ref. 1.

Figures 2 through 4 provide supportive information for the instrument responses (on microfiche) and indicate the relative locations of the detectors in the THTF. Table 4 gives the precision of the recorded instrument responses, and Table 5 groups the measurements by location and provides brief comments regarding the detectors and the recorded responses. Time zero on all graphs is the time of break initiation.

Table 4. Precision of experimental measurements for test 100

System	Standard deviation
Pressure measurement, MN/m^2 (psig)	
CCDAS	0.185 (26.8)
Analog tape system	0.197 (28.5)
Pressure difference measurement, MN/m^2 (psid)	
CCDAS	
6.89- MN/m^2 (1000-psid) span	0.025 (3.6)
1.38- MN/m^2 (200-psid) span	0.005 (0.72)
0.34- MN/m^2 (50-psid) span	0.001 (0.18)
Analog tape system	
6.89- MN/m^2 (1000-psid) span	0.033 (4.8)
1.38- MN/m^2 (200-psid) span	0.007 (0.95)
0.34- MN/m^2 (50-psid) span	0.002 (0.24)
Temperature measurement, $^{\circ}\text{K}$ ($^{\circ}\text{F}$)	2.4 (4.3)
Flow measurement, m^3/sec (gpm)	
FE-19	
Forward	+0.0009 -0.0012 (+13.97 -2.90)
