INTRODUCTION

The Los Alamos Scientific Laboratory (LASL), which is operated for the U.S. Energy Research and Development Administration by the University of California, was founded in 1943 at the site of the Los Alamos Ranch School, a boys' preparatory school in the mountains of Northern New Mexico, as part of the wartime Manhattan Project. It had a single assignment—to create the world's first nuclear fission bombs. Success in that task, one of the greatest scientific and technological achievements of all time, was followed by equal success in developing the first thermonuclear weapons. Since 1952 the Laboratory has diversified its programs, and while still serving as one of the nation's two development centers for nuclear weapons, LASL now devotes about one half of its total effort to unclassified research exploring several peaceful applications of nuclear energy, and other forms of energy. The various LASL weapons and nonweapons programs are supported by extensive fundamental research in physics, mathematics, chemistry, metallurgy, biology, medicine, and other fields.

Major non-weapons research activities at Los Alamos include an Energy Division to look especially into new technology to bring to both old energy activities and new energy sources such as solar and geothermal; the Laboratory's involvement, as one of the major participants, in Project Sherwood, the ERDA's program of research in the control of thermonuclear reactions; an accelerator facility, called LAMPF, for medium-energy nuclear physics

research; low-energy and intermediate-energy nuclear physics research using a variety of particle accelerators and neutron sources including underground nuclear explosions; and a program of medical and biological effects of radiation and basic work in molecular and cellular biology. Besides LAMPF, the experimental and test facilities of LASL, many of which are unique, include nuclear reactors, particle accelerators, and a large number of specialized laboratories. Examples are a 25-MeV, 3-stage Van de Graaff particle accelerator; a 27-MeV electron accelerator used to produce a very intense, very short burst of x rays for high-speed flash radiography; and a computing center consisting of two CDC 6600/s, four 7600/s, two CYBER-70/s, and the locally designed and built MANIAC II.

LAMPF is a \$55-million, 800-MeV, 1-mA-beam linear accelerator used to produce beams of protons, mesons, and other nuclear particles with intensities up to 10,000 greater than those available from other machines. Scyllac, an \$8.5-million toroidal theta-pinch device 25 meters in circumference, for producing thermonuclear reactions in deuterium plasmas is in operation.

LASL, as of 1975, employed about 5400 people. Scientists and engineers make up about one third of the total staff. The total operating costs—excluding construction—of the laboratory are about \$183 million per year. The value of the ERDA-owned buildings and equipment at Los Alamos is about \$500 million.

PREFACE

The Libraries' continuing program of locating, recording, and announcing publications of LASL-sponsored research has resulted in the previous publications: "Selected Bibliography of Publications of LASL Research, 1957-1962," (LAMS-2895 and supplement), and "Publications of LASL Research," for each of the years 1963 through 1974, and a five-year compilation covering the years 1967-1971 (LA-5400-MS). The most recent volume is "Publications of LASL Research 1974" (LA-5900-MS). This bibliography lists unclassified 1975 publications of work done at the Los Alamos Scientific Laboratory and those earlier publications that were received too late for inclusion in earlier compilations. Papers published in 1975 are included regardless of when they were actually written. Declassification of previously classified reports is considered to constitute publication. All classified issuances are omitted—even those papers, themselves unclassified, which were published only as part of a classified document. If a paper was published more than once, all places of publication are included.

The bibliography includes Los Alamos Scientific Laboratory reports, papers released as non-Los Alamos reports, journal articles, books, chapters of books, conference papers whether published separately or as part of conference proceedings issued as books or reports, papers published in congressional hearings, theses, and U.S. patents. Publications by LASL authors which are not records of Laboratory-sponsored work are included when the Library becomes aware of them. These publications are indicated by three asterisks following the author's name in place of a group designation.

The arrangement in each bibliographical citation is title first, place(s) of publication, indented, then authors, further indented. The *Chemical Abstracts* abbreviation is used for journal citations except for the capitalization. The group designations given after the authors' names indicate the groups with which the authors were associated at the time the papers were written. Group designations have been omitted for early declassified papers. The asterisks at the end of LA-DC and LA-UR entries indicate that the LASL Libraries ordered reprints of the papers. Parenthetical information includes report and reprint numbers, book call numbers, and patent numbers. The parentheses indicate the information

by which Los Alamos borrowers may obtain the material from the LASL Libraries.

The entries are arranged in sections by broad subject categories. Within each section they are alphabetical by title. All types of publications are interfiled.

The author and numerical indexes refer to the item numbers, which consist of a number designating the section, followed by a dash and a number for the alphabetic arrangement of the item within the section. An appendix gives a tabulation of the entries by type of publication.

There is a Keyword-in-Context index, plus a list of words not included in that index.

This bibliography has been prepared by the LASL Library Services Group, ISD-4, from the records of the Technical Information Group, ISD-6, from abstracting and indexing journals, and from supplementary library files. Inquiries regarding any of the materials included should be directed to the Serials Unit of the LASL Libraries.

The Libraries gratefully acknowledge the assistance of members of LASL's Computer Science & Services Division and the Administrative Automatic Data Processing Department for assistance with the computerized system for handling publication information.
