April 16, 2015
Summary

The Advanced Research Projects Agency—Energy, or ARPA-E, was established to “overcome the long-term and high-risk technological barriers in the development of energy technologies” (P.L. 110-69, §5012). Patterned after the widely lauded Defense Advanced Research Projects Agency (DARPA)—which played a key role in the development of critical technologies such as satellite navigation and the Internet—ARPA-E has supported more than 400 energy technology research projects since Congress first funded it in FY2009.

This budget and appropriations tracking report describes selected major items from the Administration’s FY2016 budget request for ARPA-E and tracks legislative action on FY2016 appropriations to the agency. It also provides selected historical funding data. This report will be updated to include FY2016 House- and Senate-proposed amounts, as well as final enacted appropriations, when FY2016 appropriations bills pass their respective chambers.

Overall, the Obama Administration has requested $325 million for ARPA-E in FY2016, a $45 million (16%) increase over the FY2015 enacted level of $280 million.

The Advanced Research Projects Agency–Energy, or ARPA-E, was established to “overcome the long-term and high-risk technological barriers in the development of energy technologies” (P.L. 110-69, §5012). This budget and appropriations tracking report summarizes the Administration’s FY2016 budget request for ARPA-E and tracks legislative action on FY2016 appropriations. It also provides historical funding data and an overview of selected policy debates about the agency.

Table 1 shows FY2014 current funding, FY2015 enacted funding, and the FY2016 request for ARPA-E. This table will be updated to include FY2016 House- and Senate-proposed amounts, as well as final enacted appropriations, when FY2016 appropriations bills pass their respective chambers. For a longer perspective, Table 2 provides ARPA-E authorizations, budget requests, and appropriations from FY2008 through the FY2016 request.

Appropriations to ARPA-E, which is part of the Department of Energy (DOE), typically are included in annual energy and water development and related agencies appropriations acts. (The Congressional Research Service tracks these acts each fiscal year. See the “Appropriations Status Table” on CRS.gov, at http://www.crs.gov/Pages/AppropriationsStatusTable.aspx.) ARPA-E’s budget justifications are published on the agency’s website at http://arpa-e.energy.gov/?q=arpa-e-site-page/arpa-e-budget.

ARPA-E: An Overview

Patterned after the widely lauded Defense Advanced Research Projects Agency (DARPA)—which played a key role in the development of critical technologies such as satellite navigation and the Internet—ARPA-E was first authorized by the America COMPETES Act (P.L. 110-69) in FY2008. The agency received its first appropriations in FY2009: $15 million in regular appropriations and $400 million in American Recovery and Reinvestment Act (ARRA; P.L. 111-5) funding. The America COMPETES Reauthorization Act of 2010 (P.L. 111-358) amended and reauthorized ARPA-E’s statutory authority, which is codified primarily at 42 U.S.C. 16538, and authorized appropriations to the agency through FY2013.

Although ARPA-E is relatively young by federal science agency standards, the agency asserts that its awardees already have produced significant scientific and technological gains. ARPA-E states that its awardees have

- developed a 1 megawatt silicon carbide transistor the size of a fingernail; engineered microbes that use hydrogen and carbon dioxide to make liquid transportation fuel; [and]
- pioneered a near-isothermal compressed air energy storage system.1

At the February 2015 annual ARPA-E Energy Innovation Summit, the agency announced that

- at least 30 ARPA-E project teams have formed new companies to advance their technologies and more than 37 ARPA-E projects have partnered with other government agencies for further development. Additionally, 34 ARPA-E projects have attracted more than $850 million in private-sector follow-on funding after ARPA-E’s investment of approximately $135 million and several technologies have already been incorporated into

---

products that are being sold in the market. To date, ARPA-E has invested approximately $1.1 billion across more than 400 projects through 23 focused programs and two open funding solicitations (OPEN 2009 and OPEN 2012).²

News reports indicate that ARPA-E also has cancelled 21 projects³—an expected outcome for this type of agency, which is designed to support high-risk, high-reward research that sometimes produces unanticipated (positive and negative) results. Monitoring progress and recommending termination of research projects are express statutory responsibilities of ARPA-E program directors.⁴

**FY2016 Budget Request and Appropriations**

The Obama Administration has requested $325 million for ARPA-E in FY2016, a $45 million (16%) increase over the FY2015 enacted level of $280 million. In keeping with its historical practice, the agency expects to use its FY2016 appropriations to support between 7 and 10 focused funding opportunity announcements (FOAs). Each FY2016 FOA would provide approximately $10 million to $40 million in funding for programs that focus on specific technical barriers in a specific energy area.⁵

ARPA-E groups its projects into two broad categories: transportation systems and stationary power systems. Project types can vary widely within these categories. In general, ARPA-E anticipates that the focus in FY2016 will be on transportation fuels and feedstocks; energy materials and processes; dispatchable energy; and sensors, information, and integration. The annual ARPA-E budget justification also contains a line item for program direction, which includes salaries and benefits, travel, support services, and related expenses.

⁵ In some years, ARPA-E releases “focused” FOAs, which target specific, defined technical needs. This appears to be the strategy planned for FY2016. In other years, the agency releases “open” FOAs, which “identify high-potential projects that address the full range of energy-related technologies.” FY2015 was an open FOA year. More information is available at [http://arpa-e.energy.gov/?q=programs/apply-for-funding](http://arpa-e.energy.gov/?q=programs/apply-for-funding).
Historical Funding

a. ARPA-E received $15.0 million in regular appropriations in FY2009 and $400 million in one-time appropriations through the American Recovery and Reinvestment Act (ARRA, P.L. 111-5).

Policy Issues and Observations

ARPA-E is a comparatively new addition to the federal research and development (R&D) portfolio. Given the nature of R&D, which can take decades to produce widely recognized or transformative results, it may be many years before ARPA-E’s ultimate impact is fully understood.

Some early concerns about the agency focused on perceived differences between ARPA-E and the DARPA model. These include differences in the markets for defense and energy-related products. DARPA, for example, has a built-in customer (the U.S. military), which ARPA-E does not have. Further, some analysts have argued that industrial relationships and characteristics of the energy sector (including powerful incumbent firms and the wide array of energy-dependent products) have the potential to stop the dissemination of disruptive innovations. It is not clear whether these early concerns have become actual challenges for ARPA-E, or whether ARPA-E has been able to adjust and respond to its unique position. It is also possible that factors perceived (rightly or wrongly) as key to the success of DARPA may not be as important to the success of ARPA-E.

Other early congressional concerns focused on whether ARPA-E would compete with, duplicate, or otherwise undermine other DOE research units, such as the Office of Science, and on whether
the agency would focus too closely on late-stage technology development and commercialization activities that some policymakers perceive as best left to the private sector. The Government Accountability Office investigated such concerns in 2012 and found that ARPA-E had taken steps to avoid duplication with other DOE offices and that “most ARPA-E projects could not have been funded solely by the private sector.”
