Ash Stabilization Campaign Blend Plan

I. INTRODUCTION

This Stabilization Blend Plan documents the material to be processed and the processing order for the FY95 Ash Stabilization Campaign. The primary mission of this process is to reduce the inventory of unstable plutonium bearing ash. The source of the ash is from Rocky Flats and the 232-Z incinerator at the Plutonium Finishing Plant (PFP). The ash is currently being stored in Room 235B and Vault 174 in building 234-5Z. The sludge is to be thermally stabilized in a glovebox in room 230A of the 234-5Z building and material handling for the process will be done in room 230B of the same building. The campaign is scheduled for approximately 12 - 16 weeks. A total of roughly 4 kg of Pu will be processed.

II. MATERIAL TO BE PROCESSED

There are a total of 52 ash items to be processed through the HC-21C Muffle Furnace operation. Of the 52 items, 51 are from Rocky Flats and one from PFP incinerator. The items are listed in Table 1 along with the location of the item and its net weight.

III. PROCESS ORDER

All items listed in Table 1 will be processed during the campaign. The exact items run on a daily basis will be identified on the daily Operating Instructions for the plant (OI). The daily Operating Instructions (OI) should take into consideration good ALARA practices to keep radiation dose and handling of the items to a minimum. This would include processing items from the same location at the same time.

Note: Before the campaign will actually start, a process test needs to be completed to determine the most effective processing cycle time. Items that will be used in the process test are from Table 1. The items or parts of items used for the test will be determined by the test engineer. Material used in the process test may not be stabilized during the test plan and is included in this blend plan in order to finish the stabilization of the material.
