## EXECUTIVE SUMMARY

This report describes a 30-year forecast of the solid waste volumes by container category. The volumes described are low-level mixed waste (LLMW) and transuranic/transuranic mixed (TRU TRUM) waste. These volumes and their associated container categories will be generated or received at the U.S. Department of Energy Hanford Site for storage, treatment, and disposal at Westinghouse Hanford Company's Solid Waste Operations Complex (SWOC) during a 30-year period from FY 1995 through FY 2024.

The forecast data for the 30-year period indicate that approximately 235,560 m<sup>3</sup> of LLMW and TRU TRUM waste will be managed by the SWOC. Based on ranges provided by the waste generators, this baseline volume could fluctuate between a minimum of 203,680 m<sup>3</sup> and a maximum of 260,500 m<sup>3</sup>. The main container category for this waste is 55-gallon (208-liter) drums, which will be used to ship 39% of the LLMW and TRU TRUM waste. The main waste generator forecasting the use of 55-gallon (208-liter) drums is Past Practice Remediation. This waste will be generated by the Environmental Restoration Program during remediation of Hanford's past practice sites. Although Past Practice Remediation is the primary generator of 55-gallon (208-liter) drums, most waste generators are planning to ship some percentage of their waste in 55-gallon (208-liter) drums.

Long-length equipment containers (LECs) are forecasted to contain 35% of the LLMW and TRU TRUM waste. The main waste generator forecasting the use of LECs is the Single-Shell Tank Long-Length Equipment waste generator, which is responsible for retrieving contaminated long-length equipment from the single-shell tank farms. Contact-handled LLMW makes up 98% of the waste forecasted to be shipped in LECs.

The remaining LLMW and TRU TRUM waste volume is planned to be shipped in unknown boxes and other miscellaneous containers. Unknown boxes will contain 16% of the waste, and the remaining 10% is planned to be shipped in other containers. Unknown boxes are selected by those waste generators that cannot forecast the exact box size to be used for waste shipments over the 30-year period. Unknown boxes are primarily forecasted for use when the Plutonium Finishing Plant is decontaminated and decommissioned (D&D).

The data presented in this report establish a baseline for solid waste management both in the present and future. With knowledge of the volumes by container type, decisions on the facility handling and storage requirements can be adequately made. It is recognized that the forecast estimates will vary as facility planning and missions continue to change and become better defined; however, the data presented in this report still provide useful insight into Hanford's future solid waste management requirements.

## 1.0 INTRODUCTION

This document, prepared by Pacific Northwest Laboratory (PNL) under the direction of Westinghouse Hanford Company (WHC), provides a description of the containers expected to be used for shipping low-level mixed solid waste (LLMW) and transuranic/transuranic mixed (TRU TRUM) solid waste to the Hanford Solid Waste Operations Complex (SWOC) over the next 30 years. This solid waste will be generated from ongoing operations, maintenance activities, deactivation activities, decontamination and decommissioning (D&D) of facilities, and environmental restoration (ER) activities.

For the past five years, the annual solid waste volume forecast (for the next 30 years) has been collected from all onsite and offsite generators that are planning to ship waste to the Hanford Site. The generators provide details about the amount of waste to be generated each year, the containers that will be used to ship the waste, and specific waste characteristics that help determine the proper treatment, storage, and disposal (TSD) requirements. This document, which is based primarily upon the 1994 Solid Waste Forecast, provides information on the containers intended to be used to ship waste to the Hanford Site. Volume information on the annual LLMW and TRU TRUM waste is reported in WHC-EP-0865, *1995 Solid Waste 30-Year Volume Summary*.

This document is intended to be used in conjunction with other solid waste planning documents as a reference for short- and long-term planning of the Hanford TSD activities over the next several decades. Knowledge of the number and types of shipping containers to be used by onsite and offsite waste generators aids in planning TSD facility capacities and container handling requirements. This document describes the types of containers that will be used for packaging LLMW and TRU TRUM waste. Containers used for low-level waste (LLW) are described in an appendix since LLW requires minimal treatment and storage prior to onsite disposal in the LLW burial grounds. The major waste generators for each waste category and container type are also discussed.

Because this document must serve several audiences, the information is described at various levels of detail. Section 2.0 of this report provides an overview of the overall volume by container category and waste category. Brief definitions of the container categories and waste categories are also provided. Sections 3.0 and 4.0 discuss the volumes by container category for LLMW and TRU TRUM, respectively. These sections are broken down by waste category and the associated waste containers are described. In addition, the main waste generators for each waste category and container category are discussed. Appendix A describes the LLW volumes by container category. Appendix B provides a description of the assumptions used for D&D waste generators and the other data sources that were used. Appendix C provides volume information by container category for each waste class, while Appendix D describes the waste class volumes by container category. Appendix E describes the waste volume by container category for each onsite and offsite waste generator. Lastly, Appendix F lists waste generators by program area.

## 2.0 OVERVIEW

This section provides an overview of the LLMW and TRU/TRUM solid waste volumes by waste category and container category that are expected to be generated by onsite and offsite waste generators in the next 30 years. Brief descriptions of the waste categories and container categories are provided as well. The major waste generators of the LLMW and TRU/TRUM waste volumes are also discussed. The purpose of the information presented in this overview is to provide a general description of the volumes by container category for short- and long-term planning of Hanford's solid waste management facilities in terms of TSD and handling requirements.

### 2.1 WASTE CATEGORIES

The waste volumes and container categories are described in this document by waste category. The waste is divided into four broad categories based on concentrations of radionuclides and surface dose rates of the waste package. For the purposes of this document, the contact-handled and remote-handled categories will be combined for each waste classification to form the basis of each section. The categories that are briefly described below are also found in WHC-EP-0063 Revision 4.

- **Contact-handled low-level mixed waste (CH LLMW):** This waste has a dose rate less than or equal to 200 mrem/h at contact with the waste container. The waste contains radioactivity that is not classified as transuranic waste or spent nuclear fuel; however, the waste does contain dangerous constituents as identified by Washington Administrative Code (WAC) 173-303 (Ecology 1993). The concentration of transuranic radionuclides is less than or equal to 100 nCi/g of the waste matrix.
- **Remote-handled low-level mixed waste (RH LLMW):** This waste has a dose rate greater than 200 mrem/h at contact with the waste container. The waste contains radioactivity that is not classified as transuranic waste or spent nuclear fuel; however, the waste does contain dangerous constituents as identified by WAC 173-303. The concentration of transuranic radionuclides is less than or equal to 100 nCi/g of the waste matrix.
- **Contact-handled transuranic/transuranic mixed waste (CH TRU/TRUM):** This waste has a dose rate less than or equal to 200 mrem/h at contact with the waste container. At the time of assay, this waste contains more than 100 nCi/g of alpha-emitting isotopes with atomic numbers greater than 92 and half-lives greater than 20 years. TRUM waste is TRU waste that is also dangerous waste as defined in WAC 173-303.

- **Remote-handled transuranic/transuranic mixed waste (RH TRU TRUM):** This waste has a dose rate greater than 200 mrem/h at contact with the waste container. At the time of assay, this waste contains more than 100 nCi/g of alpha-emitting isotopes with atomic numbers greater than 92 and half-lives greater than 20 years. TRUM waste is TRU waste that is also dangerous waste as defined in WAC 173-303.

## 2.2 CONTAINER CATEGORIES

In the 1994 Solid Waste Forecasts, 12 primary container categories were identified to be used to ship waste to the Hanford Site over the next 30 years. The majority of the waste will be shipped in eight of these 12 container categories: 4 x 4 x 8-ft (1.2 x 1.2 x 2.4 m) boxes, boxes less than 128 cubic feet (3.62 cubic meters), boxes between 128 and 500 cubic feet (3.62 and 14.16 cubic meters), boxes between 500 and 1,000 cubic feet (14.16 and 28.32 cubic meters), standard waste boxes, unknown boxes, 55-gallon (208-liter) drums, and long-length equipment containers. Table 2-1 has been provided to further describe specific container types by external and internal dimensions and the waste streams shipped in each. References are provided in Table 2-1 for those seeking more detailed information about the containers. It should also be noted that 1995 is a transitional year for the current unit of measurement; therefore, both the English system and the metric system of measurement will be included in the container descriptions. All container descriptions will be in the metric system next year. The following is a brief description of each major container category:

- **4 x 4 x 8-ft (1.2 x 1.2 x 2.4 m) boxes:** This shipping container is typically either plywood or metal with the dimensions of 4 feet (1.2 meters) wide, 4 feet (1.2 meters) deep, and 8 feet (2.4 meters) long. The external volume is 128 cubic feet (3.62 cubic meters) without skids attached; the external volume is 143 cubic feet (4.05 cubic meters) if skids are attached. The internal volume is 118 cubic feet (3.34 cubic meters).
- **Boxes less than 128 cubic feet (3.62 cubic meters):** This shipping container can be any box size that has an external volume of less than 128 cubic feet (3.62 cubic meters).
- **Boxes between 128 and 500 cubic feet (3.62 and 14.16 cubic meters):** This shipping container can be any box size that has an external volume greater than 128 cubic feet (3.62 cubic meters) and less than 500 cubic feet (14.16 cubic meters).
- **Boxes between 500 and 1,000 cubic feet (14.16 and 28.32 cubic meters):** This shipping container can be any box size that has an external volume greater than or equal to 500 cubic feet (14.16 cubic meters) and less than 1,000 cubic feet (28.32 cubic meters).

Table 2-1. Volumes and Waste Streams for Waste Containers

| Container                                      | External Volume<br>ft <sup>3</sup> | External Volume<br>M <sup>3</sup> | Internal Volume<br>ft <sup>3</sup> | Internal Volume<br>M <sup>3</sup> | References               | Waste Streams         |

2-4

WHC-EP-0871

- **Standard Waste Box (SWB):** This container category is a carbon steel container used for packaging TRU waste. The SWB is designed and fabricated at the Waste Isolation Pilot Plant (WIPP). Two SWBs can fit into the TRUPACT II shipping cask for eventual transport to the WIPP. The SWB has an external volume of 73.4 cubic feet (2.08 cubic meters) and an internal volume of 68.7 cubic feet (1.94 cubic meters).
- **Unknown Boxes:** This container category is an unknown shipping container with unknown dimensions. This container category is selected by those waste generators that cannot forecast the exact box size to be used for waste shipments over the next 30 years.
- **55-gallon (208-liter) drums:** This shipping container is typically 2 feet (0.6 meters) in diameter and 2.9 feet (0.88 meters) long with an external volume of 9.2 cubic feet (0.26 cubic meters). The internal volume will vary depending on the type of waste to be shipped. Table 2-1 provides the varying internal volume options.
- **Long-length equipment containers (LECs):** There are six different LECs with varying dimensions that are provided in Table 2-1. These containers are proposed containers for contaminated long-length equipment from the Tank Farms. Waste to be contained in the LECs is typically assumed to be RH LLMW or RH TRUM; however, the main waste generator forecasting the use of LECs has assumed that all the waste will be CH LLMW. Currently, the design of these containers is under review. Once the design is finalized, the new container dimensions and volumes will be used. These containers may be designed to allow the long-length equipment to be sent directly to disposal.

## 2.3 FORECASTED CONTAINER CATEGORIES AND WASTE CATEGORIES

The following describes the LLMW and TRU/TRUM waste volumes by container category and waste category. The major waste generators of LLMW and TRU/TRUM waste are also provided. This information is useful in short- and long-term planning of Hanford's solid waste management facilities in terms of TSD and handling requirements.

### 2.3.1 Volumes by Container Category

The LLMW and TRU/TRUM waste container categories forecasted for the next 30 years are displayed in Figure 2-1. As shown in the figure, the total baseline volume of waste to be shipped is approximately 235,560 m<sup>3</sup>, the maximum expected volume is 260,500 m<sup>3</sup>, and the minimum expected volume is 203,680 m<sup>3</sup>. These maximum and minimum ranges were provided by the waste generators; however, the baseline is the best estimate for future generated waste. The main

Figure 2-1. LLMW and TRU\_TRUM Waste Volumes by Container Category

container category, which is expected to contain 39% of the baseline volume, is 55-gallon (208-liter) drums. LECs will contain 35% of the baseline volume, unknown boxes 16%, and all other containers 10% of the waste.

Figure 2-2 displays the LLMW and TRU\_TRUM waste annual baseline volumes by container category. The figure shows a peak from 2013 through 2017 of approximately 14,000 m<sup>3</sup> that represents the assumed shipping schedule for D&D of the Plutonium Finishing Plant and the retrieval of the long-length equipment. The dates for shipment of D&D waste from the Plutonium Finishing Plant are unknown, and an assumption was made that, until further planning has been completed, the waste would be shipped from 2013 through 2022. Detailed information on the assumptions made for D&D generators is contained in Appendix B.

### 2.3.2 Volumes by Waste Category

The volume of LLMW and TRU\_TRUM waste is displayed by waste category in Figure 2-3. The majority of the waste is CH\_LLMW and CH\_TRU\_TRUM, which constitute 77% and 15% of the baseline volume, respectively. RH\_LLMW and RH\_TRU\_TRUM waste make up the remaining 8% of the baseline volume. Figure 2-4 displays the annual baseline volumes by waste category. The volume of waste gradually increases throughout the 30-year period, with a peak in 2013 through 2017 due to an increase in CH\_TRU\_TRUM waste. This increase in CH\_TRU\_TRUM corresponds to the assumed schedule for D&D of the PFP.

Figure 2-2. Annual Baseline Volume of LLMW and TRU\_TRUM Waste by Container Category

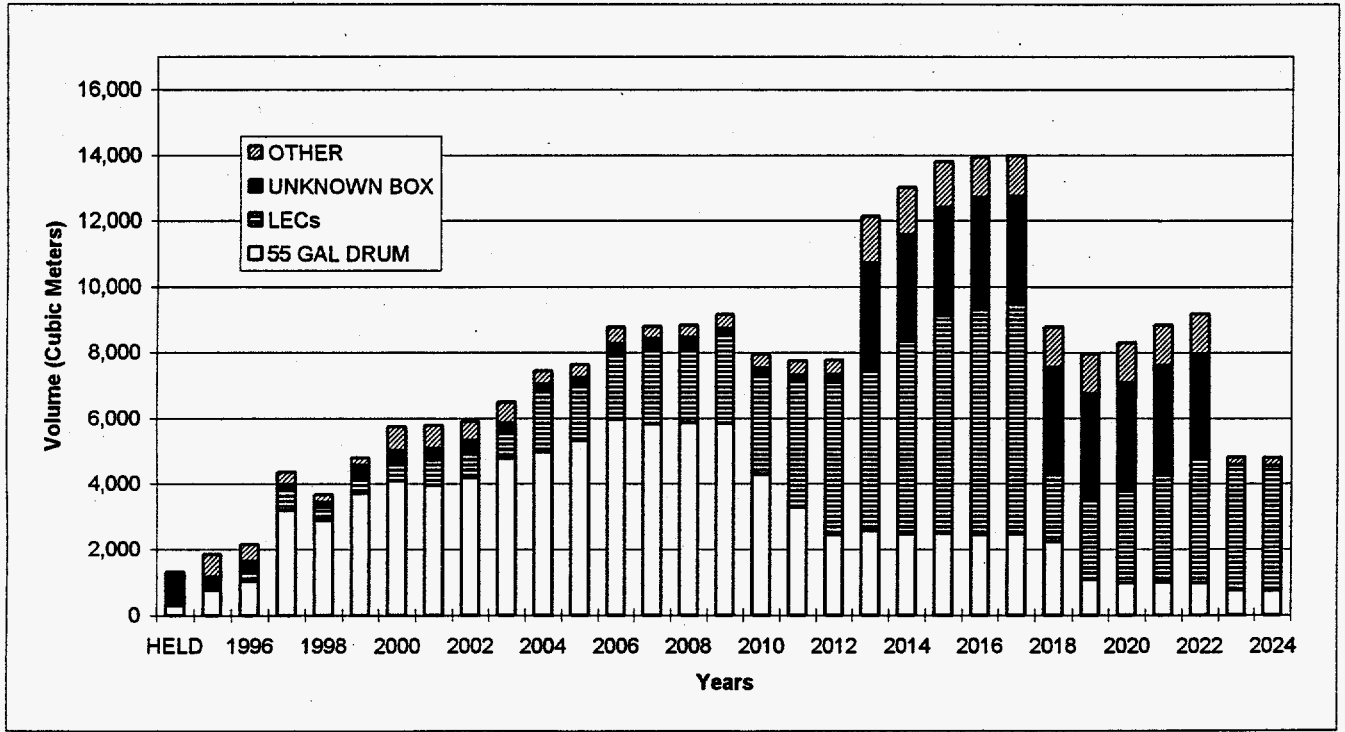

Figure 2-3. LLMW and TRU\_TRUM Waste Volumes by Waste Category

Figure 2-4. Annual Baseline Volume of LLMW and TRU\_TRUM Waste by Waste Category

### 2.3.3 Major LLMW and TRU\_TRUM Waste Generators

The major waste generators of LLMW and TRU\_TRUM waste are displayed in Figure 2.5. The largest proportion of waste is generated by the retrieval of long-length equipment from the single-shell tanks, which comprises 34% of the baseline volume. Past Practice Remediation generates 24%; D&D of the Plutonium Finishing Plant generates 10%; D&D of T Plant generates 5%; and the remaining 27% is generated by a number of other waste generators. The following is a brief description of each of these major waste generators. All assumptions associated with D&D generators are further described in Appendix B.

- SST Long-Length Equipment (WHC SSTLLE):** During tank farm cleanup, current planning is to remove the long-length pieces of contaminated equipment from the tanks and send them to the SWOC for TSD. The long-length equipment has been installed in the tanks and is greater than 12 feet in length, with some pieces in excess of 60 feet. Because of the unusual configuration of these wastes, special storage and handling requirements will be necessary. In addition to the equipment currently in the tanks, estimates have been included for pumps and other miscellaneous equipment that will be used for retrieval of tank waste. The retrieval pumps and

Figure 2-5. LLMW and TRU/TRUM Waste Generators

equipment are also expected to be sent to the SWOC for processing and will have many of the same storage and handling requirements as the long-length equipment currently in the tanks. Equipment used to resolve tank waste safety issues (e.g., the mixer pump in Tank 241-SY-101) has not been included in these estimates.

This generator forecasted all of its waste to be CH\_LLMW\_III. There is a high possibility, however, that much or all of the waste will be remote-handled. In addition, some of this waste may also be TRUM depending on the degree of decontamination at the time of removal from the waste tank. Both of these issues could significantly affect the TSD options being considered for the long-length contaminated equipment. In addition, there is a possibility that the long-length contaminated equipment may not be sent to the SWOC for processing; however, this scenario was not an option when the forecast data were submitted. This new scenario would dramatically reduce the expected volume of waste at the SWOC.

- Past Practice Remediation Projects (PAST\_PAC\_REM):** It is assumed that the SWD Program will be responsible for the TRU/TRUM waste and LLMW of past practice sites because the SWD Program will have treatment technologies for this waste. The Environmental Restoration Division (ERD) is responsible for other remediation wastes. The wastes included for this generator are 10% of the total LLMW generated, all expected TRU/TRUM waste and greater-than-class III waste; all other waste will be handled by ERD. WHC-IP-0977 did not

distinguish between LLW and LLMW for greater-than-class III waste; therefore, for the purpose of this document, this waste was assumed to be LLMW.

- **D&D of Plutonium Finishing Plant (TWHC PFP):** In operational mode, the PFP processed plutonium-based chemical solutions and converted them to metals and oxides. The D&D volume estimate includes the canyon building 2345-Z and its associated buildings 241-Z, 242-Z, and 236-Z. Contaminated materials included in the volume estimate are gloveboxes, pedestal storage, ventilation systems, pencil tanks, and ventilation fans.
- **D&D of T-Plant (TWHC TPLANT):** T Plant, a canyon building, is used to decontaminate equipment and sort and package waste from other facilities. Solid waste from the D&D of T Plant includes primarily contaminated equipment such as pumps, tanks, jumpers, and silver reactors.

### 3.0 LOW-LEVEL MIXED WASTE

This section provides waste volumes by container category and waste category for LLMW. The major waste generators of LLMW are also described. LLMW will be treated and stored at the SWOC and shipped to the onsite mixed waste trench for disposal.

#### 3.1 LLMW VOLUME

The total baseline amount of LLMW to be shipped to the SWOC in the next 30 years is approximately 188,830 m<sup>3</sup>. The maximum and minimum volumes of LLMW expected are 209,080 m<sup>3</sup> and 161,600 m<sup>3</sup>, respectively. Of the baseline volume, 96% is CH\_LLMW, while the remaining 4% is RH\_LLMW, as depicted in Figure 3-1. Figure 3-2 displays the annual baseline volume of LLMW by waste category. As depicted in the figure, the volume of LLMW gradually increases until the volume peaks at approximately 10,000 m<sup>3</sup> in 2017, corresponding to the retrieval of long-length equipment from the single-shell tank farms.

Figure 3-3 displays the major waste generators of LLMW. Forty-three percent will be generated by Single-Shell Tank Long-Length Equipment; Past Practice Remediation will generate 26%; Buried Equipment will generate 4%; and the remaining 27% will be generated by other miscellaneous waste generators. These waste generators were described in Section 2.0 with the exception of Buried Equipment, which is briefly described below:

Figure 3-1. LLMW Volumes by Waste Category

Figure 3-2. Annual Baseline Volume of LLMW by Waste Category

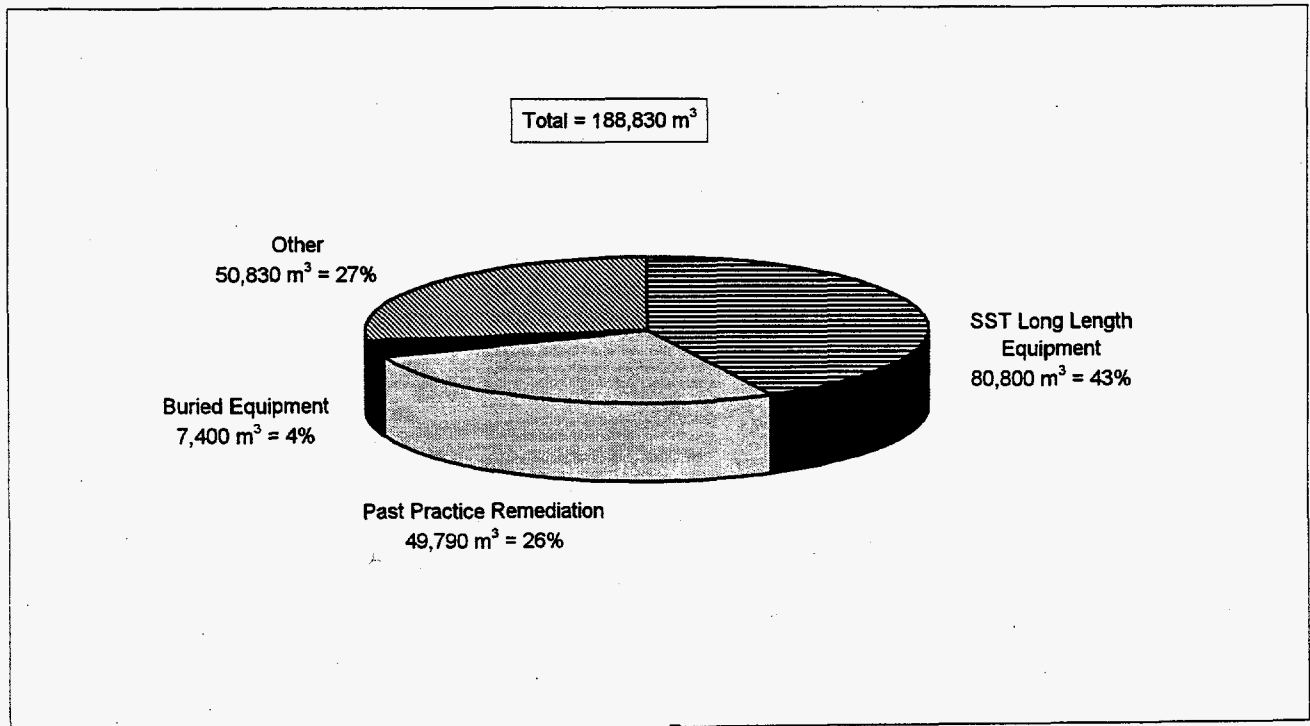

Figure 3-3. Major LLMW Generators

- **Buried Equipment (WHC BQUIP):** This generator disposes of general purpose coded equipment. Wastes include vehicles and mobile construction units used in tank farms. The 1992 Solid Waste Forecast was used for this generator since a 1993 and 1994 Solid Waste Forecast was not submitted due to funding issues. The volumes forecasted are based on past experience and waste that was not buried in 1992-1994 due to lack of funding. The waste that has not been buried is located with the respective waste generators. Thus the schedule for this generator is uncertain, but the volumes are certain because the waste currently exists. Since maximum and minimum ranges were not collected in 1992, these data are not available for Buried Equipment; therefore, 100% minimum and maximum ranges were assumed.

### 3.2 COMPARISON WITH 1994 FORECASTED LLMW

The total amount of LLMW that was reported from 1994 through 2023 in the *1994 Solid Waste Forecast Container Volume Summary* (WHC-EP-0803) was 221,050 m<sup>3</sup>. The 1995 reported data for LLMW shows a volume decrease of 32,220 m<sup>3</sup>. The decrease in forecasted RH\_LLMW is considerable, about 91,189 m<sup>3</sup>. The decrease in forecasted RH\_LLMW volumes is primarily due to the re-characterization of the Single-Shell Tank Long-Length Equipment as CH\_LLMW, which accounts for approximately 80,804 m<sup>3</sup>. Decreases in the overall LLMW are due to the following waste generators:

- Portsmouth Gaseous Diffusion Plant CH\_LLMW volumes have decreased by approximately 15,000 m<sup>3</sup> due to a clearer mission scope for environmental restoration activities; therefore, forecasted volumes were refined to correspond to the better defined mission.
- The Low-Level Waste Vitrification Project (formerly the grout facility) no longer forecasts RH\_LLMW, which accounted for 4,298 m<sup>3</sup>. This is due to a change in the treatment technology from a grout to a vitrification technology.
- The 200 Area Effluent Treatment Facility's (ETF) CH\_LLMW volumes have decreased by 3,400 m<sup>3</sup>. The ETF has refined its facility plans and expects to generate less solid waste.
- Tank Farm Restoration forecasted 1,710 m<sup>3</sup> less CH\_LLMW in this year's forecast request.
- A reduction in forecasted RH\_LLMW volumes for T Plant and no forecasted RH\_LLMW for 106-C sluicing result in an overall reduction of 509 m<sup>3</sup>.
- Additional CH\_LLMW decreases in Argonne National Laboratory - East, the 222-S Laboratory, and the Low Level Vitrification Project occurred in this year's forecast request.

### 3.3 LLMW CATEGORIES BY CONTAINER CATEGORY

A brief description of each waste category of LLMW by container category is included below. The total volume is discussed, as are the annual volumes in terms of the main container categories forecasted for shipment to the SWOC. The waste generators for each waste category are also described.

#### 3.3.1 Contact-Handled Low-Level Mixed Waste

The total baseline amount of CH LLMW to be shipped to the SWOC in the next 30 years is approximately 182,160 m<sup>3</sup>. The maximum and minimum volumes expected are 201,520 m<sup>3</sup> and 155,720 m<sup>3</sup>. Figure 3-4 displays the baseline, maximum, and minimum volumes of CH LLMW by container category. As depicted in the figure, 44% of the baseline volume will be shipped in long-length equipment containers (LECs), 42% in 55-gallon (208-liter) drums, 6% in unknown boxes, and the remaining 8% in other miscellaneous containers.

Figure 3-5 displays the annual baseline volumes of CH LLMW by container category. There is a gradual increase in the amount of waste until 2017, when it peaks at approximately 10,000 m<sup>3</sup>. From 2018 through 2024, waste generation is approximately 5,000 m<sup>3</sup>. This is reflective of the Single-Shell Tank Farm

Figure 3-4. CH\_LLMW Volumes by Container Category

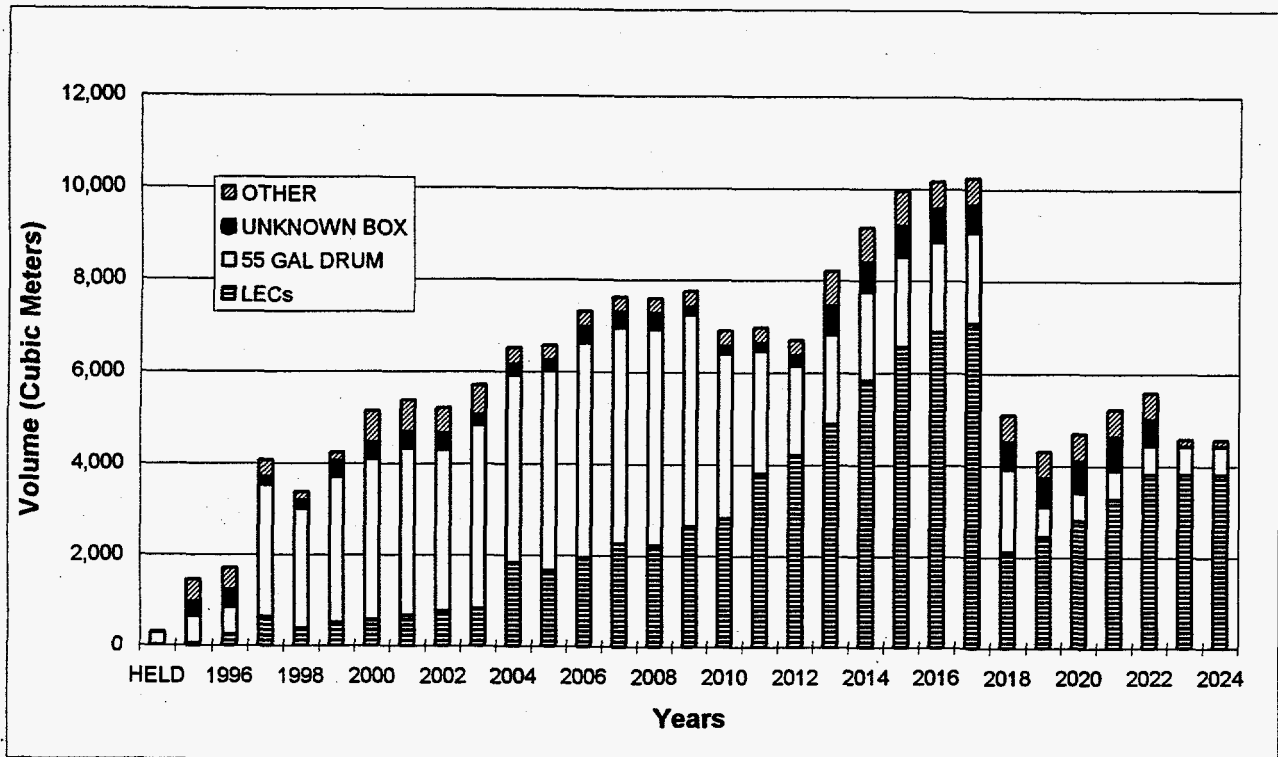

Figure 3-5. Annual CH\_LLMW Baseline Volumes by Container Category

Long-Length Equipment shipping schedule; they plan to ship the majority of their waste from 2004 through 2017 in LECs. The amount of waste to be shipped in 55-gallon (208-liter) drums is fairly constant from 1997 through 2011, which reflects the schedule of Past Practice Remediation.

The CH\_LLMW volumes for each waste generator are displayed by main container categories in Table 3-1. LECs that contain CH\_LLMW are forecasted by Single-Shell Tank Long-Length Equipment only. The majority of 55-gallon (208-liter) drums are generated by the Past Practice Remediation waste generator; this is the only container type Past Practice Remediation forecasts. Buried Equipment and D&D of T Plant are the primary users of unknown boxes.

### 3.3.2 Remote-Handled Low-Level Mixed Waste

The total baseline amount of RH\_LLMW to be shipped to the SWOC over the next 30 years is approximately 6,670 m<sup>3</sup>. Of the total RH\_LLMW forecasted, 47% will be shipped in 55-gallon (208-liter) drums, 24% in unknown boxes, 17% in LECs, 10% in 4 x 4 x 8-ft (1.2 x 1.2 x 2.4 m) boxes, and the remaining 2% in other miscellaneous containers. Figure 3-6 displays the baseline, maximum, and minimum RH\_LLMW volumes by container category. The maximum and minimum volumes expected are 7,560 m<sup>3</sup> and 5,890 m<sup>3</sup>, respectively.

Figure 3-7 displays the annual baseline volume of RH\_LLMW by container category. The figure shows approximately 200 m<sup>3</sup> that is designated as "held"

Table 3-1. CH\_LLMW Generators by Container Category (in cubic meters)<sup>(a)</sup>

| Waste Generator                             | LECs   | 55 Gal Drum | Unknown Box | Other | Total  |

(a) Sum of individual values may not match totals due to rounding.

waste, which represents the PUREX tunnel waste. Waste volumes gradually increase, with a peak from 2006 through 2009 that is due to the expected shipping schedule for Surplus Facilities. Another peak occurs in 2012 due primarily to the LECs that are expected from the DST Retrieval. The remaining years are constant at approximately 250 m<sup>3</sup>.

Figure 3-6. RH\_LLMW Volumes by Container Category

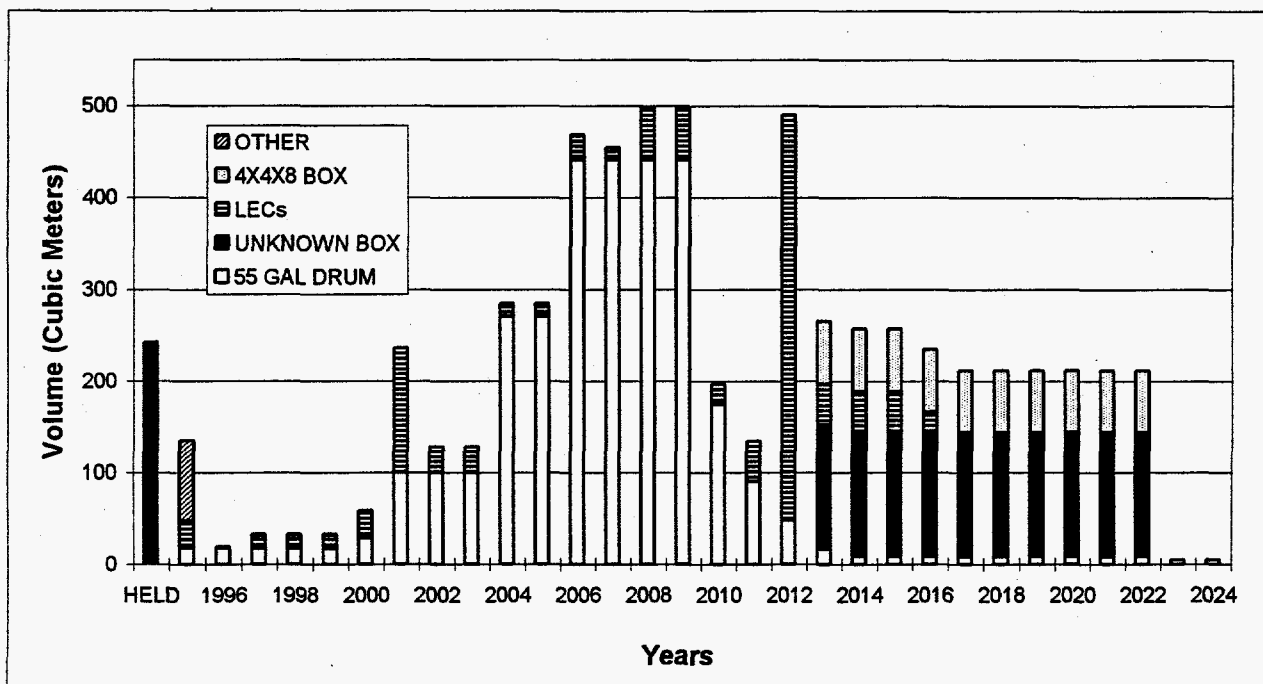

Figure 3-7. Annual RH\_LLMW Baseline Volumes by Container Category

The waste generators for RH LLMW by major container category are displayed in Table 3-2. Fifty-five gallon (208-liter) drums that contain RH\_LLMW are forecasted primarily by Surplus Facilities. Unknown boxes are used primarily for the D&D of T Plant, D&D of PNL 324 Building, and PUREX tunnel waste. LECs that contain RH\_LLMW are forecasted by DST retrieval of 17 tanks, DST Retrieval Systems of 10 tanks, and 101-AZ Retrieval. The 4 x 4 x 8-ft (1.2 x 1.2 x 2.4 m) boxes are forecasted for use primarily for the D&D of T Plant.

#### 4.0 TRANSURANIC AND TRANSURANIC MIXED WASTE

This section provides waste volumes by container category and waste category for TRU/TRUM waste. The major waste generators of TRU/TRUM waste are also described. TRU/TRUM waste will be treated and stored in the SWOC, with ultimate disposal planned for the Waste Isolation Pilot Plant (WIPP) in Carlsbad, New Mexico.

#### 4.1 TRU/TRUM WASTE VOLUME

The total baseline amount of TRU/TRUM waste to be shipped to the SWOC over the next 30 years is approximately 46,730 m<sup>3</sup>. Of this waste, 75% is CH/TRU/TRUM waste, while the remaining 25% is RH/TRU/TRUM waste, as depicted in Figure 4-1. Figure 4-1 also displays the maximum and minimum waste volumes expected, which are 51,420 m<sup>3</sup> and 42,070 m<sup>3</sup>, respectively. Figure 4-2 displays the annual baseline volumes for TRU/TRUM waste by waste category. As shown in the figure, the volumes remain at approximately 600 m<sup>3</sup> from 1995 through 2012. From 2013 through 2022, the TRU/TRUM annual volume increases to approximately 3,100 m<sup>3</sup>, which represents the expected D&D of the Plutonium Finishing Plant and other non-surplus facilities. The schedule for these non-surplus facilities was assumed to be from 2013 through 2022.

Figure 4-1. TRU/TRUM Waste Volumes by Waste Category

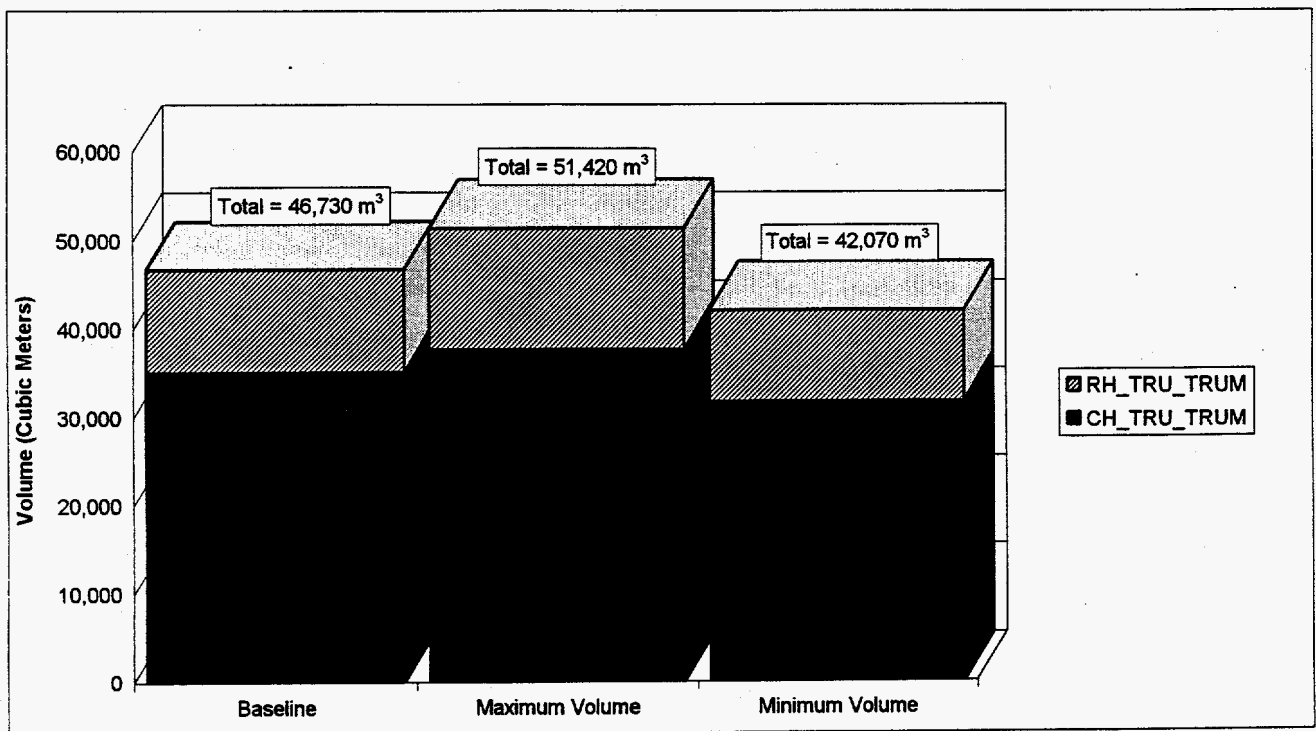

Figure 4-2. Annual Baseline Volumes of TRU\_TRUM Waste by Waste Category

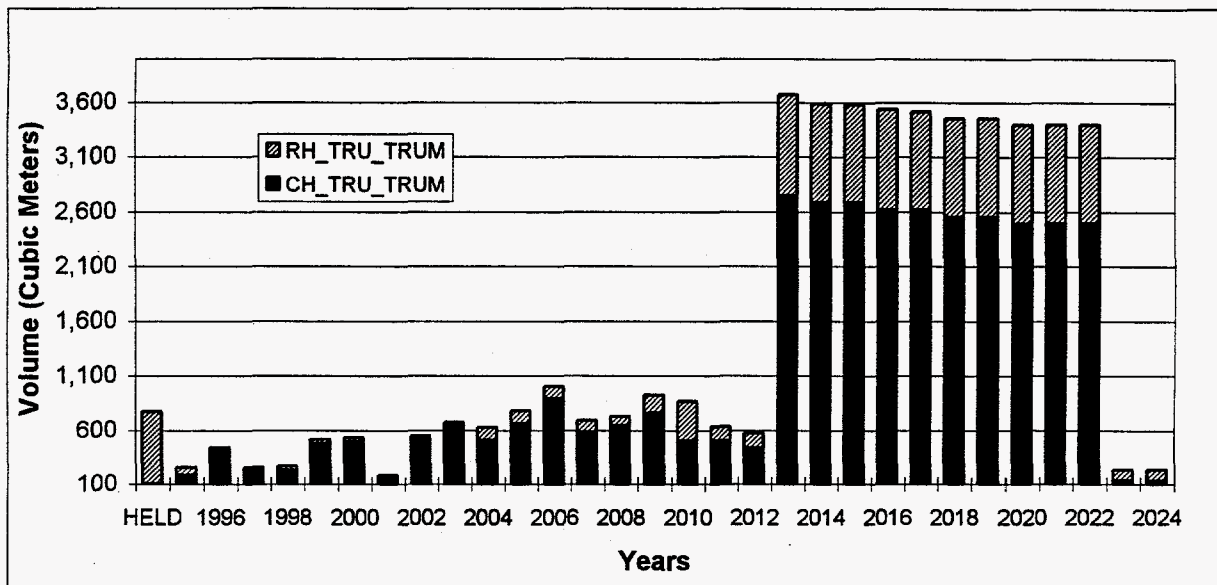

Figure 4-3 displays the major waste generators of TRU\_TRUM waste. The major waste generator of TRU\_TRUM is D&D of the Plutonium Finishing Plant, which is responsible for 49% of the waste. Past Practice Remediation will generate 13% of the baseline waste; D&D of T Plant will generate 10%; and the remaining 28% will be generated by other waste generators. These major waste generators were described in Section 2.0.

#### 4.2 COMPARISON WITH 1994 FORECASTED TRU\_TRUM WASTE

The total amount of TRU\_TRUM waste that was reported from 1994 through 2023 in the *1994 Solid Waste Forecast Container Volume Summary* (WHC-EP-0803) was 86,100 m<sup>3</sup>. The 1995 reported data for TRU\_TRUM waste shows a volume decrease of 39,370 m<sup>3</sup>. The decrease in forecasted TRU\_TRUM waste volumes is due to the following waste generators:

- Cancellation of the Double-Shell Tank Process Tests (or Tank Farm LLW Pretreatment Facility), which forecasted approximately 18,414 m<sup>3</sup> of RH\_TRU\_TRUM waste.
- Characterization of the Single-Shell Tank Long-Length Equipment as CH\_LLMW instead of RH\_TRU\_TRUM, as was the case in 1994. This accounts for a decrease in TRU\_TRUM waste of 9,748 m<sup>3</sup>.
- Elimination of the D&D volumes for the High-Level Vitrification Project since these D&D volumes are expected to occur after the 30-year forecasting period. This accounts for approximately 7,215 m<sup>3</sup> of CH\_TRU\_TRUM.

Figure 4-3. Major TRU\_TRUM Waste Generators

- Decreases in waste volumes for the Plutonium Finishing Plant, Lawrence Livermore National Laboratory, and the High-Level Vitrification Project (formerly Hanford Waste Vitrification Plant).

#### 4.3 TRU\_TRUM WASTE CATEGORIES BY CONTAINER CATEGORY

The following describes the volumes of each waste category of TRU\_TRUM waste by container category. The total volume is discussed as are the annual volumes in terms of the main container categories forecasted for shipment to the SWOC. The waste generators for each waste category are also described.

##### 4.3.1 Contact-Handled Transuranic\_Transuranic Mixed Waste

The total baseline amount of CH\_TRU\_TRUM waste to be shipped to the SWOC over the next 30 years is approximately 35,100 m³. Figure 4-4 displays the baseline, maximum, and minimum volumes of CH\_TRU\_TRUM waste by container category. As depicted in the figure, 53% of the baseline volume will be shipped in unknown boxes; 36% in 55-gallon (208-liter) drums, 8% in 4 x 4 x 8-ft (1.2 x 1.2 x 2.4 m) boxes, and the remaining 3% in other miscellaneous containers. The maximum and minimum expected volumes are 37,690 m³ and 31,720 m³, respectively.

Figure 4-5 displays the annual baseline volumes of CH\_TRU\_TRUM waste by container category. As displayed in the figure, there is a fairly constant amount of waste until 2013; then the volume increases dramatically to 2,500 m³. The amount of waste is constant through 2022, which reflects the assumed shipping dates for the D&D of the Plutonium Finishing Plant. In addition, the figure displays a large amount of unknown boxes from 2013 through 2022, which is reflective of the container type selected by the

Figure 4-4. CH\_TRU\_TRUM Waste Volumes by Container Category

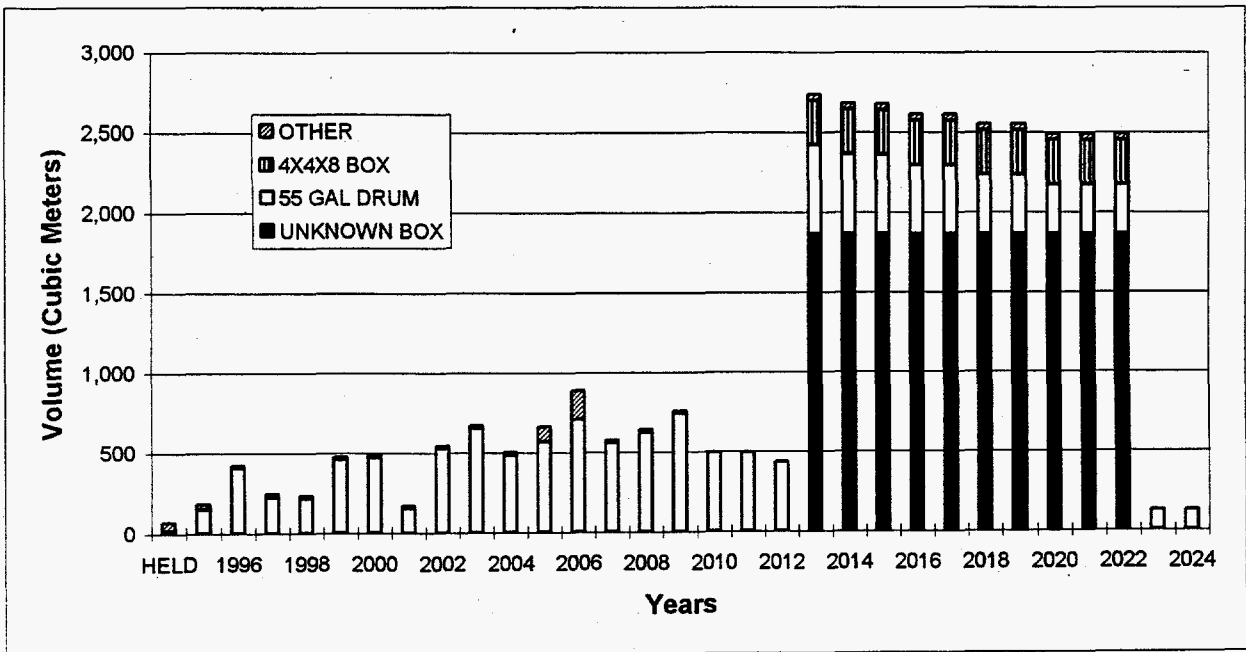

Figure 4-5. Annual Baseline Volumes of CH\_TRU\_TRUM Waste by Container Category

Plutonium Finishing Plant. The dates for shipment of D&D waste from the Plutonium Finishing Plant are unknown, and an assumption was made that, until further planning has been completed, the waste would be shipped from 2013 through 2022.

The waste generators of CH TRU TRUM waste by main container category are displayed in Table 4-1. D&D of the Plutonium Finishing Plant is the primary user of unknown boxes, while Past Practice Remediation uses most of the 55-gallon (208-liter) drums for CH TRU TRUM. The 4 x 4 x 8-ft (1.2 x 1.2 x 2.4 m) boxes are used mainly for CH TRU TRUM waste from the D&D of the Plutonium Finishing Plant and D&D of T Plant.

4.3.2 Remote-Handled Transuranic Transuranic Mixed Waste

The total baseline amount of RH TRU TRUM waste to be shipped to the SWOC over the next 30 years is approximately 11,630 m<sup>3</sup>. Figure 4-6 displays the baseline, maximum, and minimum RH TRU TRUM waste volumes by container category. Of the baseline RH TRU TRUM waste forecasted, 58% will be shipped in unknown boxes. Standard Waste Boxes (SWBs) will hold 15% of the waste; 55-gallon (208-liter) drums will contain 11%; and the remaining 16% will be in other miscellaneous containers. The maximum and minimum expected volumes are 13,730 m<sup>3</sup> and 10,350 m<sup>3</sup>, respectively.

Figure 4-7 displays the annual baseline volumes of RH TRU TRUM waste by container category. The figure depicts a large held waste volume, which represents the PUREX tunnel waste. Waste volumes remain constant and relatively low until 2012. From 2013 through 2022, waste volumes increase to approximately 900 m<sup>3</sup>. This increase represents the D&D of non-surplus facilities such as PFP and T Plant. As displayed in the figure, the majority of waste will be packaged in unknown boxes.

The main waste generators for RH TRU TRUM waste by major container category are displayed in Table 4-2. The main waste generators that forecast the use of unknown boxes are D&D of the Plutonium Finishing Plant and D&D of the N Reactor. The High-Level Vitrification Project is the only generator that forecasts the use of the SWB. Fifty-five gallon (208-liter) drums are used by many of the RH TRU TRUM waste generators.

Intentionally Left Blank

## APPENDIX A

## LOW-LEVEL WASTE

This appendix provides waste volumes by container category and waste category for LLW. The major waste generators of LLW are also described. LLW will not be handled by the SWOC except for selective sampling. The majority of the LLW is currently planned to go directly to the Hanford LLW burial grounds. LLW is subdivided into two main waste categories, contact-handled and remote-handled LLW, which are described below.

- **Contact-handled low-level waste (CH\_LLW):** This waste has a dose rate less than or equal to 200 mrem/h at contact with the waste container. The waste contains radioactivity that is not classified as transuranic waste, radioactive mixed waste, or spent nuclear fuel. The concentration of transuranic radionuclides is less than or equal to 100 nCi/g of the waste matrix.
- **Remote-handled low-level waste (RH\_LLW):** This waste has a dose rate greater than 200 mrem/h at contact with the waste container. The waste contains radioactivity that is not classified as transuranic waste, radioactive mixed waste, or spent nuclear fuel. The concentration of transuranic radionuclides is less than or equal to 100 nCi/g of the waste matrix.

## A.1 LLW VOLUME

The total baseline amount of LLW to be shipped to the SWOC over the next 30 years is approximately 1,461,580 m<sup>3</sup>. Of this waste, 96% is CH\_LLW, while the remaining 4% is RH\_LLW, as depicted in Figure A-1. Figure A-1 also displays the maximum and minimum expected waste volumes as 1,594,180 m<sup>3</sup> and 1,381,860 m<sup>3</sup>, respectively. Figure A-2 displays the annual baseline volume of LLW by waste category. As depicted in the figure, waste volumes gradually increase from 2002 through 2007, where they peak at approximately 210,000 m<sup>3</sup>. This peak corresponds to the expected shipping schedule of Surplus Facilities.

Figure A-3 displays the major waste generators of LLW. Seventy-six percent will be generated by Surplus Facilities; the Formerly Utilized Sites Remediation Action Program (FUSRAP) will generate 4%; D&D of B Plant will generate 3%; and the remaining 17% will be generated by other miscellaneous waste generators. The following is a brief description of each generator:

- **Surplus Facilities (WHC\_SURPLS\_FAC):** Surplus Facilities includes surplus listed facilities and projects. This generator has indicated that waste minimization, recycling, or reduction technologies could reduce forecasted volumes by 30%.

Figure A-1. Total LLW Volume by Waste Category

Figure A-2. Annual LLW Baseline Volume by Waste Category

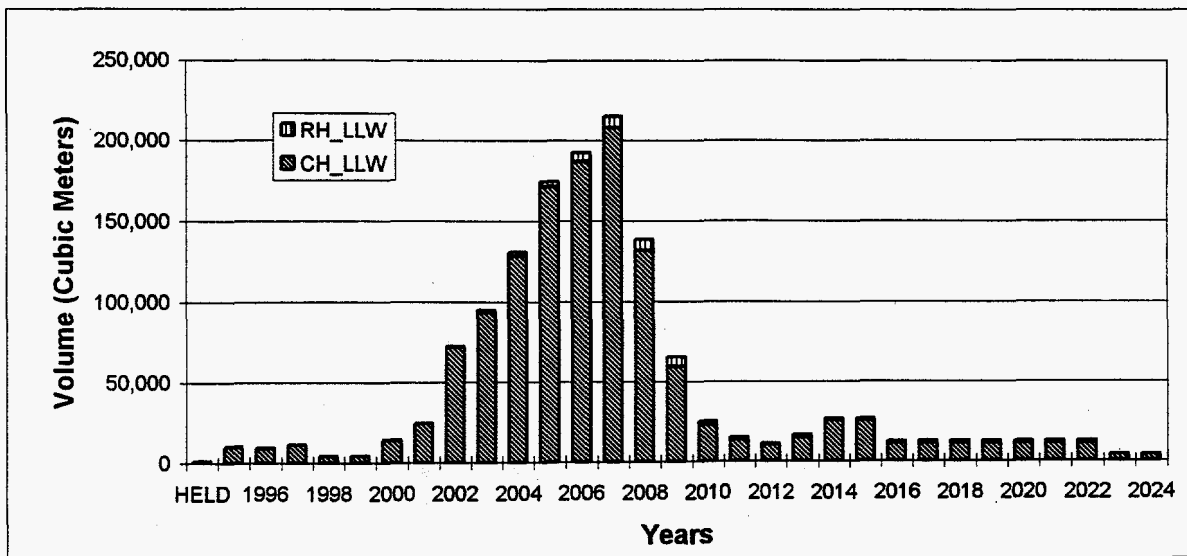

Figure A-3. Major LLW Generators

- FUSRAP:** FUSRAP is one of several Department of Energy (DOE) programs created to address radiological contamination in excess of guidelines at a number of sites throughout the U.S. Generally, these sites, which became contaminated through uranium and thorium operations, were decontaminated and released for use under the regulations in effect at the time. Since radiological guidelines were not as strict then as today, trace amounts of radioactive materials remained at some of the sites. Erosion, building demolition, and construction resulted in some of the radioactive residues mixing with large volumes of soil and rubble, thereby spreading the contamination. If FUSRAP becomes responsible for restoring more sites, their waste volumes could increase. Minimum and maximum ranges were not available for this generator.
- D&D of B-Plant (TWHC BPLANT):** The volume estimates for B-Plant were obtained by determining the volume of the building from its dimensions. An assumption was made that half of the building volume was contaminated material. In addition, one-third of the Waste Encapsulation and Storage Facility (WESF) was assumed contaminated. Contaminated materials include tanks, jumpers, concentrators, ion exchange columns, filters, ducting, piping, and condensers. Minimum and maximum ranges were not available for this generator.

**A.2 LLW CATEGORIES BY CONTAINER CATEGORY**

The following describes the LLW volumes by waste category and container category. The total volume is discussed as are the annual volumes in terms of the main container types forecasted for shipment to the SWOC. The waste generators for each waste category are also described.

**A.2.1 Contact-Handled Low-Level Waste**

The total baseline amount of CH\_LLW to be shipped to the SWOC over the next 30 years is approximately 1,403,200 m<sup>3</sup>. Figure A-4 displays the baseline, maximum, and minimum volumes of CH\_LLW by container category. The maximum and minimum expected volumes are 1,532,370 m<sup>3</sup> and 1,325,770 m<sup>3</sup>, respectively. As depicted in the figure, 51% of the baseline volume will be shipped in 4 x 4 x 8-ft (1.2 x 1.2 x 2.4 m) boxes, 25% in unknown boxes, 9% in other drums, 8% in 55-gallon (208-liter) drums; and the remaining 7% in other miscellaneous containers.

Figure A-5 displays the annual baseline volumes of CH\_LLW by container category. As shown in the figure, there is a gradual increase in waste volume from 2002 through 2007. This peak represents the shipping schedule of 4 x 4 x 8-ft (1.2 x 1.2 x 2.4 m) boxes by the Surplus Facilities waste generator.

The waste generators for CH\_LLW by major container category are displayed in Table A-1. Surplus Facilities is the major generator of CH\_LLW and is the primary user of all of the CH\_LLW container categories. FUSRAP is a major

contributor of 4 x 4 x 8-ft (1.2 x 1.2 x 2.4 m) boxes, while D&D of B Plant will require primarily unknown boxes for its CH LLW. The High-Level Vitrification Project is also a major contributor of 4 x 4 x 8-ft (1.2 x 1.2 x 2.4 m) boxes.

#### A.2.2 Remote-Handled Low-Level Waste

The total baseline amount of RH LLW to be shipped to the SWOC over the next 30 years is approximately 58,390 m<sup>3</sup>. Figure A-6 displays the baseline, maximum, and minimum volumes of RH LLW by container category. The maximum and minimum expected volumes are 61,800 m<sup>3</sup> and 56,090 m<sup>3</sup>, respectively. Of the baseline RH LLW forecasted, 68% will be shipped in other cylinders. This container type is typically 74.5 inches in diameter and 72.5 inches high, which gives it an external volume of 179 cubic feet. This container type is basically exclusive to the Surplus Facilities waste generator and is used to ship their RH LLW that is greater-than-Class III. Unknown boxes contain 19% of the waste; 8% will be in 4 x 4 x 8-ft (1.2 x 1.2 x 2.4 m) boxes; and the remaining 5% is in other miscellaneous containers. Figure A-7 displays the annual baseline volume of RH LLW by container category. The figure shows a peak from 2002 through 2009 that represents the shipping schedule of other cylinders from the Surplus Facilities waste generator.

The waste generators for RH LLW by major container category are displayed in Table A-2. Other cylinders are the main container category generated primarily by Surplus Facilities. Unknown boxes are primarily generated by D&D of B-Plant, and 4 x 4 x 8-ft (1.2 x 1.2 x 2.4 m) boxes are generated mainly by the Hanford Waste Vitrification Project.

APPENDIX B

ASSUMPTIONS FOR SUPPLEMENTARY SOURCES

WHC-EP-0871

Intentionally Left Blank

## APPENDIX B

## ASSUMPTIONS FOR SUPPLEMENTARY SOURCES

This appendix briefly describes the references used to supplement the FY 1994 Solid Waste Forecasts and any assumptions made in using these references.

Fiscal Year (FY) 1993 Solid Waste Forecasts:

Several generators that completed a FY 1993 forecast did not complete the FY 1994 forecast. These generators include those that were given the option of completing a new forecast (as discussed in Section 1.0) as well as other generators that did not complete forecasts for various reasons. In these cases, the FY 1993 forecast data were included in the FY 1994 data set. Since the FY 1993 forecast covered the years 1994 to 2023, and the FY 1994 forecast covers the years 1995 to 2024, the data for 1994 were not used, and the data for 2023 were duplicated in 2024. The minimum and maximum volumes were assumed to be the same as the baseline.

Draft Report: Waste Stream Evaluation for Long-Term Decontamination Study:

This special study investigated potential D&D waste generators that are not on the surplus facilities list. Hundreds of facilities exist on the Hanford Site that will require D&D. To limit the study, two sources were used to identify 26 facilities with potentially large D&D volumes: the 1992 Solid Waste Forecast database and the Programmatic Environmental Impact Statement database. Waste information was gathered primarily through interviews with operational and waste personnel. Some estimates were developed by briefly touring the building and estimating the amount of equipment or contaminated material. Data include rough estimates of the waste volumes by waste class, physical characteristics, and possible container types. The shipment of this waste was assumed to begin in 2013 and conclude in 2022.

For the purpose of completing the 30-Year Summary Report, the following assumptions and data revisions were made:

- Only the volume and waste category data were used.
- Building demolition and soil excavation activities are not expected to be managed by Solid Waste; therefore, the physical waste category *construction material* and the waste generator *Secondary Environmental Restoration* were not used.

- Volumes for PUREX and the PUREX tunnels were not used since volumes for these facilities were obtained from another source (WHC-IP-0977).
- Volumes for the canyon buildings, B Plant, T Plant, and the Plutonium Finishing Plant were used, but a ratio of 80% contact-handled to 20% remote-handled was based upon personal conversation with Ken Hladek (WHC), Solid Waste Disposal, Systems Engineering Manager.
- Volumes associated with the Hanford Waste Vitrification Plant and the Grout facility were not used because these projects have been cancelled, and the projects that are scheduled to replace them will not undergo D&D until after the 30-year forecast period.

Estimation of PUREX Equipment and Materials that are Candidates for Removal and Waste Processing During PUREX Plant Closure, WHC-IP-0977 (Valero 1994)

This study is a detailed investigation of potential waste from PUREX and the PUREX tunnels, two facilities not listed on the surplus facilities list that are expected to generate large volumes of D&D waste. Volumes and waste category information were obtained from this study; however, no distinction was made between contact-handled and remote-handled waste. Therefore, a ratio of 80% contact-handled to 20% remote-handled was assumed, based upon personal conversation with Ken Hladek (WHC), Solid Waste Disposal, Systems Engineering Manager.

This document also states that surveillance and maintenance waste will peak at 20% of the current waste generation rate (pp. 2-6). It was assumed that the current generation rates corresponded to the last year (FY 1998) that volumes were provided in the FY 1994 forecasts for PUREX. The volumes provided in the forecast for 1998 were multiplied by 20% to obtain the annual generation rate for PUREX surveillance and maintenance waste. A schedule for this waste was not provided. It was assumed that surveillance and maintenance would occur from 1999 through 2011. This assumption is based on completion of transition (deactivation) in 1998 as estimated in the forecast and D&D beginning in 2012, as assumed by the draft report discussed above.

Hanford Restoration Baseline Approach - Interface Control Document, WHC-SD-ER-EE-002 Rev. 0 (Casbon 1993)

This document describes the responsibilities of the Solid Waste and Environmental Restoration (ER) programs in the remediation of Hanford's past practice sites. It also provides waste volume estimates and identifies program responsibilities. The Environmental Division's (ERD) responsibilities

include planning, field operations, environmental remediation, and site cleanup of unplanned release sites, inactive waste sites, and other areas contaminated with radioactive or chemical hazards. The SWD is responsible for the management of centralized facilities for the receipt, containment, treatment, storage, and disposal of solid waste at Hanford. The SWD Program will provide storage of LLMW and TRU\_TRUM waste; burial of LLW; treatment and disposal of LLW and LLMW; and characterization, size reduction, certification, packaging, and shipment of TRU waste to the Waste Isolation Pilot Program.

At this time, TRU\_TRUM waste will not be handled by ERD; therefore, the SWD Program will receive this waste. Any waste that the SWD Program has treatment technologies for may also be sent to this program rather than ERD.

The volumes included in the forecast data were developed from estimates of solid waste generation provided in the Hanford Restoration Baseline Approach. This document states the following assumptions for remedial action wastes:

- 10% of the LLMW is expected to be sent to SWD.
- All of the TRU, TRUM, and greater-than-class III (GTC\_III) is expected to be sent to SWD. (Although WHC-SD-ER-002 did not specify the GTC\_III waste as LLW or LLMW, it was assumed to be LLMW for the purposes of this document.)
- All waste is expected to be contact-handled.

The volumes were modified according to these guidelines and included in the Forecast Database under the Past Practice Remediation waste generator.
