EXECUTIVE SUMMARY

This document, prepared by Pacific Northwest Laboratory (PNL) under the direction of Westinghouse Hanford Company (WHC), describes the characteristics of the waste to be managed at Hanford's Solid Waste Operations Complex (SWOC) over the next 30 years. The characteristics discussed are the physical waste forms and the hazardous waste constituents for low-level mixed waste (LLMW) and transuranic/transuranic-mixed waste (TRU TRUM). Low-level waste (LLW) is described by physical waste forms in Appendix A, since the majority of LLW will not require treatment.

The data presented in this report will change as waste generator planning and missions change and/or become better defined. However, the information still provides useful insights into Hanford's solid waste management needs, both for the present and the future. Waste characteristic information is provided to assist in planning Hanford's treatment, storage, and disposal (TSD) activities over the next several decades.

A baseline volume of approximately 235,560 m³ of LLMW and TRU TRUM waste is expected to be managed at Hanford's SWOC over the next 30 years. Based on range information provided by the individual waste generators, this baseline volume could fluctuate between a maximum of 260,500 m³ and a minimum of 203,680 m³.

The main physical waste form that will be present in the baseline volume is steel shielding, which will make up 30% of the LLMW and TRU TRUM waste. Retrieval of long-length equipment from the single-shell tank farms is the primary source of steel shielding. The decontamination and decommissioning of the Plutonium Finishing Plant will generate a large portion of the metal debris, which is a major physical waste form that will make up 27% of the waste. The other major physical waste form that will comprise 23% of the LLMW and TRU TRUM waste is contaminated soil, generated primarily by Past Practice Remediation.

The main hazardous waste constituents of the LLMW and TRUM waste are organics mixed with metals without mercury, which are expected to be present in 43% of the mixed waste. The main generator of this hazardous constituent is Single-Shell Tank Long-Length Equipment. Metals without mercury will contaminate 17% of the waste, which is generated primarily by Past Practice Remediation. Corrosive hazardous constituents will be present in 13% of the LLMW and TRU TRUM waste as a result of Past Practice Remediation.

1.0 INTRODUCTION

The Hanford Site has been designated by the U.S. Department of Energy (DOE) to store, treat, and dispose of solid waste received from both onsite and offsite generators. This waste is currently or planned to be generated from ongoing operations, maintenance and deactivation activities, decontamination and decommissioning (D&D) of facilities, and environmental restoration (ER) activities.

For the past five years, each onsite and offsite generator has provided an annual forecast of the waste volume that it plans to ship to Hanford's Solid Waste Operations Complex (SWOC) over the next 30 years. Each generator's forecast summarizes the waste that will be sent to the Hanford Site including the waste volume, container data, physical waste forms, hazardous constituents, and radionuclide data if available. After analyzing the 1995 forecasts, it was determined that additional waste was expected from onsite D&D and remedial action (RA) activities. Special studies and interviews were conducted to obtain these volumes. These special study volumes and the 1994 30-year forecast waste volumes are outlined in the *1995 Solid Waste 30-Year Volume Summary* (Valero et al. 1995). This document describes the waste characteristics (physical waste forms and hazardous constituents) for the solid waste volumes reported in that document.

This document, prepared by Pacific Northwest Laboratory (PNL) under the direction of Westinghouse Hanford Company (WHC), describes the characteristics of the waste to be shipped to Hanford's SWOC. The physical waste forms and hazardous constituents are described for the low-level mixed waste (LLMW) and the transuranic-transuranic mixed waste (TRU-TRUM). Low-level waste (LLW) characteristics are provided in Appendix A of this report.

An overall LLMW and TRU-TRUM waste baseline volume of 235,560 m³ is expected to be managed at the SWOC. Based on ranges provided by the waste generators, this baseline volume could fluctuate between a minimum of 203,680 m³ and a maximum of 260,500 m³. The largest portion of the baseline waste will be CH-LLMW, which is expected to account for 77% (182,160 m³) of the total baseline volume. RH-LLMW accounts for another 3% (6,670 m³), CH-TRU-TRUM for 15% (35,100 m³), and RH-TRU-TRUM for 5% (11,630 m³).

Section 2.0 provides an overview of the waste volumes described by waste categories, which are contact-handled (CH) LLMW, remote-handled (RH) LLMW, CH-TRU-TRUM, and RH-TRU-TRUM. The waste characteristics are also defined in Section 2.0. Sections 3.0 and 4.0 describe the physical waste forms and hazardous constituents of the LLMW and TRU-TRUM waste, respectively.

Low-level waste (LLW) characteristics are provided in Appendix A. Appendix B contains a table from the 1994 forecast that was sent to each generator to complete. This table provides the possible physical waste forms and hazardous constituents of the waste contributed by the generators. Appendix C contains a database report summarizing the 1994 Forecast annual

waste category volumes by physical waste form and hazardous waste constituent. Appendix D contains a database report of the volumes of the physical waste forms and hazardous constituents for each waste generator. A list of waste generator abbreviations is provided in Appendix E.

2.0 OVERVIEW

This section provides a high-level description of the LLMW and TRU/TRUM solid waste volumes by waste category that are expected to be generated by onsite and offsite waste generators in the next 30 years. Brief descriptions of the waste categories, physical waste characteristics, and hazardous constituents are provided as well. The major waste generators of the LLMW and TRU/TRUM waste volumes are identified and discussed. The purposes of the information presented in this section are to provide a general description of the volumes that will be managed within Hanford's solid waste management facilities and to identify the terms that will be used throughout this report.

2.1 WASTE CATEGORIES

The waste volumes and waste characteristics are described in this document by waste category. The waste is divided into four broad categories based on concentrations of radionuclides and surface dose rates of the waste package. For the purposes of this document, the contact-handled (CH) and remote-handled (RH) categories will be combined for each waste classification to form the basis of each section. The categories are briefly described below:

- Contact-handled low-level mixed waste (CH_LLMW): This waste has a dose rate less than or equal to 200 mrem/h. The waste contains radioactivity that is not classified as transuranic waste or spent nuclear fuel; however, the waste does contain dangerous constituents as identified by Washington Administrative Code (WAC) 173-303 (Ecology 1993). The concentration of transuranic radionuclides is less than or equal to 100 nCi/g of the waste matrix.
- Remote-handled low-level mixed waste (RH_LLMW): This waste has a dose rate greater than 200 mrem/h. The waste contains radioactivity that is not classified as transuranic waste or spent nuclear fuel; however, the waste does contain dangerous constituents as identified by WAC 173-303. The concentration of transuranic radionuclides is less than or equal to 100 nCi/g of the waste matrix.
- Contact-handled transuranic/transuranic mixed waste (CH_TRU/TRUM): This waste has a dose rate less than or equal to 200 mrem/h at contact with the waste. At the time of assay, this waste contains more than 100 nCi/g of alpha-emitting isotopes with atomic numbers greater than 92 and half-lives greater than 20 years. TRUM waste is TRU waste that is also classified as dangerous waste as defined in WAC 173-303.
- Remote-handled transuranic/transuranic mixed waste (RH_TRU/TRUM): This waste has a dose rate greater than 200 mrem/h at contact with

the waste. At the time of assay, this waste contains more than 100 nCi/g of alpha-emitting isotopes with atomic numbers greater than 92 and half-lives greater than 20 years. TRUM waste is TRU waste that is also classified as dangerous waste as defined in WAC 173-303.

2.2 PHYSICAL WASTE CHARACTERISTICS

In the 1994 Solid Waste Forecasts, waste volumes are further defined by the specific physical characteristics that will be generated. The main physical characteristics of most of the waste volume can be delineated into these eight main categories, which are based on the DOE final Treatability Group Guidance document:

- Inorganics - material that has an inorganic matrix or content.
- Organics - chemical compounds based on carbon, hydrogen, and oxygen, usually derived from living matter.
- Debris - wastes that meet the U.S. Environmental Protection Agency (EPA) criteria for "debris." Debris materials are divided into four groups as either metal (inorganic), inorganic non-metal, combustible (organic), or mixtures of materials (heterogeneous). If the waste is dominated by one type of material it should be classed as that material; otherwise, it is classified as heterogeneous.
- Labpacks/Containerized Liquids - various quantities of compatible waste within the same DOT hazard class, packaged in vessels such as cans or bottles.
- Soils - soil contaminated with hazardous and/or radioactive materials.
- Shielding - the three types of shielding include steel, lead, and concrete. It is assumed that, if shielding is required, then the shielding material is handled as solid waste.
- Void Space - space within a container that is not occupied by waste.
- Unknown - in several cases, physical waste form information is not known; therefore, "unknown" has been used to denote these areas of uncertainty.

2.3 HAZARDOUS WASTE CHARACTERISTICS

In the 1994 Solid Waste Forecasts, hazardous characteristics are identified for radioactive and hazardous mixed waste and hazardous waste. These hazardous characteristics can be divided into eight main categories that may be individual or mixed. Several hazardous constituents might be present in a particular waste form and require definition by waste volume percentage as mixed hazardous constituents (e.g., if a physical waste form in a 55-gallon drum contains ignitables and corrosives, then the package is 100% ignitables and corrosives). A brief definition of the nine main hazardous characteristics that were used for this report follows:

- Ignitables (D001) - term used by Ecology (WAC 173-303-090) for a waste that can cause a fire through friction, absorption of moisture, or spontaneous chemical reaction.
- Corrosives (D002) - any liquid or solid that causes destruction of human skin tissue or that has a severe corrosion rate on steel.
- Reactive Metals (D003) - typically sodium metal or alkali metal alloys but can also be particulate fines of aluminum, uranium, zirconium, or other pyrophoric materials, and may be mixed with stabilizing materials.
- Metals Without Mercury (D004-D011) - toxic metals that are not contaminated with mercury.
- Metals with Mercury (D009, P065, P092, U151) - toxic metals that are specifically contaminated with mercury.
- Toxic Organics (D018-D043) - toxic organics.
- State Regulated - waste that is defined as hazardous only under Washington State regulations.
- PCBs - polychlorinated biphenyl-contaminated materials (designated in 40 CFR 761 or WAC 173-303-071) where PCB concentration is further divided into two categories: less than 50 parts per million (ppm) and greater than 50 ppm.
- Unknown - in some cases, hazardous constituent data are not known; "Unknown" has been used to denote these areas of uncertainty.

2.4 FORECASTED CHARACTERISTICS AND WASTE CATEGORIES

This section provides a brief summary of the waste volumes that will be generated by physical waste forms, hazardous constituents, and waste category. This information provides an overview of the quantities of waste that will be

sent to the Hanford Site for future treatment, storage, and disposal and provides a profile of each of the waste generators planning on shipping large quantities of waste to the SWOC.

2.4.1 Volumes by Physical Waste Form

The baseline, minimum, and maximum volumes of LLMW and TRU/TRUM waste are represented by physical waste form in Figure 2-1. As shown in the figure, the expected baseline volume is 235,560 m³, the minimum is 203,680 m³, and the maximum is 260,500 m³. The maximum and minimum ranges were provided by the individual waste generators; however, the baseline volume is the best estimate for future generated waste. The main physical waste form is steel shielding from Single-Shell Tank Long-Length Equipment, which comprises 30% of the baseline volume. Metal debris will comprise 27% of the baseline, 23% will be contaminated soil, and the remaining 20% will be made up of other physical waste forms.

Figure 2-2 displays the LLMW and TRU/TRUM annual baseline waste volumes by physical waste form. The figure shows that contaminated soils is the major waste form from 1997 to 2010; after that, steel shielding and then metal debris are the predominant forms. The peak from 2013 through 2017 represents the assumed schedule for D&D of the Plutonium Finishing Plant (PFP) and retrieval of long-length equipment. The dates for shipment of D&D waste from

Figure 2-1. LLMW and TRU/TRUM Waste Volumes by Physical Waste Form

Figure 2-2. Annual Baseline Volume of LLMW and TRU_TRUM Waste by Physical Waste Form

the PFP are not now known; however, an assumption was made that until further planning has been completed, the waste will be shipped from 2013 through 2022. Detailed information on the assumptions made for D&D waste generators is contained in Templeton et al. (1995).

2.4.2 LLMW and TRU_TRUM Waste Volumes by Hazardous Waste Constituents

Figure 2-3 displays the baseline, maximum, and minimum volumes by hazardous constituents. Only LLMW and TRUM waste is represented since only these waste categories contain hazardous constituents. Organics mixed with metals without mercury comprise 43% of the LLMW and TRUM waste volume. Metals without mercury comprise 17%, corrosives are expected to be 13%, and the remaining 27% is other hazardous constituents.

2.4.3 LLMW and TRU_TRUM Waste Volumes by Waste Category

The baseline, maximum, and minimum volumes by waste category are displayed in Figure 2-4. The majority of the waste over the next 30 years is expected to be CH_LLMW, which comprises 77% of the total baseline volume. The main generator of the CH_LLMW is Single-Shell Tank Long-Length Equipment, which is described in Section 2.4.4. CH_TRU_TRUM will comprise 15%, while RH_LLMW and RH_TRU_TRUM will make up the remaining 8% of the baseline volume.

- Single-Shell Tank Long-Length Equipment (WHC_SST_LLE): During tank farm cleanup, it is planned to remove the long-length pieces of equipment from the tanks and send it to the SWOC for TSD. The long-length equipment has been installed in the tanks and is more than 3.66 m (12 ft) in length; some pieces are in excess of 18.29 m (60 ft). Because of the unusual configuration of these wastes, special storage and handling requirements will be necessary. In addition to the equipment currently in the tanks, estimates have been included for pumps and other miscellaneous equipment that will be used for retrieval of tank waste. The retrieval pumps and equipment are also expected to be sent to the SWOC for processing and will have many of the same storage and handling requirements as the long-length equipment.

The major waste generators of LLMW and TRU/TRUM waste are displayed in Figure 2-5. The largest portion of waste is generated by the retrieval of long-length equipment from the single-shell tank farm, which comprises 34% of the baseline volume. Past Practice Remediation will generate 24%; D&D of the Plutonium Finishing Plant will generate 10%; D&D of T Plant will generate 5%, and the remaining 27% is generated by a number of other waste generators. Following is a brief description of each of these major waste generators. All assumptions associated with D&D generators are described in Templeton et al. (1995).

2.4.4 Major LLMW and TRU/TRUM Waste Generators

Figure 2-3. LLMW and TRUM Waste Volumes by Hazardous Waste Constituent

Figure 2-4. LLMW and TRU_TRUM Waste Volumes by Waste Category

Figure 2-5. LLMW and TRU_TRUM Waste Generators

This generator forecasted all of its waste to be CH_LLMW_III. There is a high possibility, however, that much or all of the waste will be remote-handled. In addition, some of this waste may also be TRUM, depending on the degree of decontamination at the time of removal from the waste tank. Both of these issues could significantly affect the TSD options being considered for the long-length contaminated equipment. In addition, there is a possibility that the long-length contaminated equipment might not be sent to the SWOC for processing; however, this scenario was not an option when the forecast data were submitted. This new scenario would dramatically reduce the expected volume of waste at the SWOC.

- **Past Practice Remediation Projects (PAST_PRAC_REM):** It is assumed that the SWD Program will be responsible for the TRU_TRUM waste and a portion of the LLMW from past practice sites, because they will have treatment technologies for this waste. The Environmental Restoration Division (ERD) is responsible for other remediation wastes. The wastes included for this generator are 10% of the total LLMW generated and all expected TRU_TRUM waste and greater-than-Class-3 waste; all other waste will be handled by ERD. *Estimation of PUREX Equipment and Materials That are Candidates for Removal and Waste Processing During PUREX Plant Closure (LATA 1994)* did not distinguish between LLW and LLMW for greater-than-Class-3 waste; for the purposes of this document, this waste was assumed to be LLMW.
- **D&D of Plutonium Finishing Plant (TWHC_PFP):** In operational mode, the PFP processed plutonium-based chemical solutions and converted them to metals and oxides. The D&D volume estimate includes the canyon building 2345-Z and its associated buildings 241-Z, 242-Z, and 236-Z. Contaminated materials included in the volume estimate are glove boxes, pedestal storage, ventilation systems, pencil tanks, and ventilation fans.
- **D&D of T-Plant (TWHC_TPLANT):** T Plant, a canyon building, is used to decontaminate equipment and sort and package waste from other facilities. Solid waste from the D&D of T Plant includes predominately contaminated equipment such as pumps, tanks, jumpers, and silver reactors.

2.5 WASTE CHARACTERISTIC ASSUMPTIONS

Forecast data were not provided for waste expected from past practice sites (Past Practice Remediation waste generator). Thus physical waste form characteristics were based on data from 100 and 300 Area Remedial Action sites (200 Area sites have not been included but would not change the physical characteristics split). Hazardous waste characteristics for soil are based on hazardous chemical data for 25 inactive liquid waste discharge sites in the 100 Areas, as reported in the Waste Information Database System (WIDS). It is

assumed that 300 Area liquid discharge sites would also be contaminated with metals without mercury and corrosives. Metal debris waste would come mainly from burial grounds and buried pipelines; these sites are assumed to be contaminated with metals without mercury as well. Table 2-1 displays the assumptions used for Past Practice Remediation.

Waste characteristics data were not available for several waste generators, or the available data were inconsistent. In cases where no information was available, the physical waste form or hazardous waste constituent was simply listed as unknown. The total volume of waste for which physical waste form data were unavailable is 8,623 m³. The volume of waste for which no hazardous waste constituent data were available amounts to 23,279 m³. In all cases, waste without physical waste forms had no hazardous waste constituents; however, several generators provided physical waste form information but were unable to provide hazardous waste constituent data.

Table 2-1. Past Practice Remediation Characteristic Assumptions

Waste Generator	Waste Class	Physical Waste Form Assumption	Hazardous Waste Constituent Assumption
Past Practice Remediation	CH_LLMW	92% contaminated soils 7% debris contaminated soils 1% metal debris	50% corrosives 50% metals without mercury
	CH_TRU_TRUM	9% contaminated soils 1% debris contaminated soils 45% metal debris 45% inorganic non-metal debris	

Intentionally Left Blank

3.0 LOW-LEVEL MIXED WASTE

This section provides LLMW volumes by waste category, physical waste form, and hazardous constituents. The major waste generators of LLMW are also listed. Valero et al. (1995) provides more detailed information on the individual waste generators and their missions. Templeton et al. (1995) also provides a comparison of the 1994 reported LLMW volumes with the LLMW volumes reported in 1995.

3.1 LOW-LEVEL MIXED WASTE VOLUME

Approximately 188,830 m³ of LLMW will be shipped to the SWOC in the next 30 years; however, the maximum amount expected is 209,080 m³, and the minimum is 161,600 m³. As depicted in Figure 3-1, the majority (96%) of the LLMW is CH_LLMW, and 4% of the baseline volume is RH_LLMW.

Figure 3-2 displays the annual baseline waste volumes for the next 30 years by waste category. The volume of LLMW gradually increases until it peaks in 2017 at approximately 10,000 m³. This gradual increase corresponds to the expected retrieval of the long-length equipment from the single-shell tank farms.

The major waste generators of LLMW are depicted in Figure 3-3. As shown, 43% is generated by Single-Shell Tank Long-Length Equipment. Other primary contributors of LLMW include Past Practice Remediation (26%), Buried Equipment (4%), and other waste generators (27%).

Figure 3-1. LLMW Volumes by Waste Category

Figure 3-2. Annual Baseline Volume of LLMW by Waste Category

Figure 3-3. Major LLMW Generators

3.2 LOW-LEVEL MIXED WASTE CATEGORIES BY PHYSICAL WASTE FORM

CH_LLMW and RH_LLMW volumes by physical waste form are described in the following sections. The annual volumes by physical waste form are included, as are the waste generators.

3.2.1 Contact-Handled Low-Level Mixed Waste

The total baseline volume of CH_LLMW to be shipped to the SWOC in the next 30 years is approximately 182,160 m³, while the expected maximum and minimum volumes are 201,520 m³ and 155,720 m³, respectively. Figure 3-4 provides the breakout of the physical waste forms for CH_LLMW. As shown in the figure, 39% of the CH_LLMW is expected to be steel shielding. Contaminated soil will account for another 30%, metal debris for 16%, and other physical waste forms approximately 15%.

Figure 3-5 displays the annual CH_LLMW baseline volumes by physical waste form. As shown in the figure, waste volumes gradually increase until 2017 due to the increase in steel shielding generated by Single-Shell Tank Long-Length Equipment. From 1997 through 2010, the volume of contaminated soil from Past Practice Remediation remains at approximately 2,500 m³ annually. In 2018, the annual generated volumes decrease to approximately 4,000 m³ due to the near-completion of long-length equipment retrieval and to the operations of Past Practice Remediation.

Table 3-1 provides the volumes forecasted by each waste generator arranged by primary physical waste forms. The only waste generator of the CH_LLMW steel shielding is Single-Shell Tank Long-Length Equipment. As shown in the table, Past Practice Remediation is the primary contributor of

CH_LLMW-contaminated soils. Metal debris is generated primarily by Single-Shell Tank Long-Length Equipment, Buried Equipment, and D&D of T Plant.

3.2.2 Remote-Handled Low-Level Mixed Waste

Approximately 6,670 m³ of RH_LLMW will be shipped to the SWOC over the next 30 years. The maximum and minimum volumes expected are 7,560 m³ and 5,890 m³, respectively. Figure 3-6 displays the total RH_LLMW volume by physical waste form. Almost 38% of the RH_LLMW forecasted to be shipped to SWOC is metal debris. Twenty-nine percent of the RH_LLMW will be organic particulates, 13% will be void space in the containers, and the remaining 20% will be other physical waste forms.

Annual RH_LLMW baseline volumes are depicted in Figure 3-7. The 242 m³ of "HELD" waste is forecasted by the PUREX tunnels. Annual volumes peak in 2006 through 2009 at approximately 500 m³ due to the large amounts of organic particulates expected to be generated by Surplus Facilities. In 2012, the volume also peaks at 500 m³ due to the amount of void space forecasted by Double-Shell Tank Retrieval. From 2012 through 2022, the waste will be primarily metal debris, due to the predicted schedule for D&D of T Plant.

Figure 3-6. RH_LLMW Volumes by Physical Waste Form

Figure 3-7. Annual RH_LLMW Baseline Volume by Physical Waste Form

As shown in Table 3-2, Surplus Facilities is the primary generator of the RH_LLMW organic particulates. D&D of T Plant is the main contributor of metal debris, while Double-Shell Tank Retrieval generates the largest portion of void space.

3.3 LOW-LEVEL MIXED WASTE CATEGORIES BY HAZARDOUS WASTE CONSTITUENTS

A description of the CH_LLMW and RH_LLMW by the hazardous constituents that contaminate the waste is included below. The total volume and the waste generators for each waste category are also provided.

3.3.1 Contact-Handled Low-Level Mixed Waste

The total baseline volume of CH_LLMW to be shipped to the SWOC in the next 30 years is approximately 182,160 m³, while the maximum and minimum volume ranges are 201,520 m³ and 155,720 m³, respectively. The primary hazardous constituents that will contaminate the CH_LLMW are depicted in Figure 3-8. As shown in the figure, 50% of the waste is mixed with organics and metal without mercury; 18% contains metals without mercury; 14% will contain corrosives; organics and other hazardous constituents will each contain 9% of the baseline volume.

Table 3-2. RH_LLMW Generators by Physical Waste Form^(a,b)

Waste Generator	Metal Debris	Organic Particulates	Void Space	Other	Total

Figure 3-8. CH_LLMW Volumes by Hazardous Waste Constituent

Figure 3-9 displays the annual CH_LLMW baseline volumes by hazardous waste constituents. Metals without mercury mixed with organics gradually increases through 2017, which corresponds to the retrieval of the long-length equipment from the single-shell tank farms. After 2017, metals without mercury mixed with organics decreases significantly due to the near-completion of the long-length equipment retrieval. In addition, metals without mercury and corrosives are predominant from 1997 through 2010 due to Past Practice Remediation's expected shipping schedule.

The major generators that forecast the above hazardous constituents are provided in Table 3-3. Single-Shell Tank Long-Length Equipment is the primary producer of metals without mercury mixed with organics, forecasting approximately 89% of the volume contaminated with this hazardous constituent. Past Practice Remediation is the primary generator of waste containing metals without mercury and waste containing corrosives. This generator forecasted 76% of the CH_LLMW containing metals without mercury and 94% of the waste contaminated with corrosives.

3.3.2 Remote-Handled Low-Level Mixed Waste

Approximately 6,670 m³ of RH_LLMW will be shipped to the SWOC over the next 30 years. The maximum and minimum expected volumes are 7,560 m³ and 5,890 m³, respectively. Figure 3-10 displays the RH_LLMW baseline volume

Figure 3-10. RH_LLMW Volumes by Hazardous Waste Category

according to the hazardous constituents that contaminate the waste. As shown, 29% of the forecasted RH LLMW will contain organics; 27% will contain metals without mercury; 17% will contain corrosives; and 16% of the waste has no hazardous constituent data available.

Figure 3-11 displays the annual RH LLMW baseline volumes by hazardous constituents. The held volume is forecasted by the PUREX tunnels, which does not have hazardous constituent data available. In 2012, waste generation by Double-Shell Tank Retrieval also generates waste with unknown hazardous constituents. The peak from 2004 through 2009 is due to large amounts of metals without mercury and corrosives being generated by Surplus Facilities. The organic waste is constant from 2013 through 2022 since this waste will be generated during D&D of T Plant. The schedule for the waste from D&D of T Plant was assumed to be uniformly distributed from 2013 to 2022.

The major waste generators of the RH LLMW contaminated with the above hazardous waste constituents are listed in Table 3-4. Surplus Facilities is the primary generator of both metals without mercury and corrosives. D&D of T Plant will generate most of the organic contaminated waste; in fact, this is the only waste generated by D&D of T Plant.

Intentionally Left Blank

4.0 TRANSURANIC AND TRANSURANIC MIXED WASTE

This section provides waste volumes by physical waste form and hazardous constituents for TRU TRUM waste. The major waste generators of TRU TRUM waste are also described. The *1995 Solid Waste 30-Year Volume Summary* (Valero et al. 1995) provides more detailed information about these waste generators and their missions; the *1995 Solid Waste 30-Year Container Volume Summary* (Templeton et al. 1995) provides a comparison of the 1994 and 1995 reported TRU TRUM waste volumes.

4.1 TRU TRUM WASTE VOLUME

The baseline amount of TRU TRUM waste to be shipped to the SWOC over the next 30 years is approximately 46,730 m³. The maximum reported volume is 51,420 m³, while the minimum reported volume is 42,070 m³. As shown in Figure 4-1, 75% of the TRU TRUM baseline waste is CH TRU TRUM, while the remaining 25% is RH TRU TRUM. Figure 4-2 displays the annual baseline volume of TRU TRUM waste by waste category. As shown in the figure, the volumes remain at approximately 600 m³ from 1995 through 2012. From 2013 through 2022, the TRU TRUM annual volume increases to approximately 3,100 m³, which reflects the

Figure 4-1. TRU TRUM Waste Volumes by Waste Category

Figure 4-2. Annual Baseline Volumes of TRU_TRUM Waste by Waste Category

anticipated schedule for D&D of the Plutonium Finishing Plant (PFP) and other non-surplus facilities. The schedule for these non-surplus facilities was assumed to be from 2013 through 2022.

The major waste generators of TRU_TRUM waste are depicted in Figure 4-3. As shown, 49% will be generated by D&D of the PFP; Past Practice Remediation comprises 13%; D&D of T-Plant will generate 10%; and the remaining 28% will be generated by other waste generators.

4.2 TRU_TRUM WASTE CATEGORIES BY PHYSICAL WASTE FORM

A description of the CH_TRU_TRUM and RH_TRU_TRUM by physical waste form is included below. The total volume and the waste generators for each waste category are also described.

4.2.1 Contact-Handled Transuranic and Transuranic Mixed Waste

The baseline volume of CH_TRU_TRUM to be shipped to the SWOC in the next 30 years is approximately 35,100 m³. The minimum and maximum ranges are 31,720 m³ and 37,690 m³, respectively. Figure 4-4 displays the baseline, minimum, and maximum volumes of CH_TRU_TRUM by physical waste forms. As displayed, 68% of the CH_TRU_TRUM baseline waste is metal debris. The primary generator of the CH_TRU_TRUM metal debris is D&D of the PFP. Figure 4-5 depicts the annual CH_TRU_TRUM baseline waste volumes by physical waste form. From 1995 through 2012 volumes remain relatively low, at approximately 500 m³ and are composed primarily of metal debris and inorganic non-metal debris. From 2013 through 2022, the annual volume increases to approximately 2,500 m³,

Figure 4-3. Major TRU/TRUM Waste Generators

Figure 4-4. CH/TRU/TRUM Volumes by Physical Waste Form

Figure 4-5. Annual CH_TRU_TRUM Baseline Volumes by Physical Waste Form

which corresponds to the expected schedule for D&D of the PFP. During these years, the waste is primarily metal debris.

As shown in Table 4-1, D&D of PFP forecasts 72% of the metal debris. Past Practice Remediation is the primary generator of inorganic non-metal debris, while the PFP and the High-Level Vitrification Project are the main producers of combustible debris.

4.2.2 Remote-Handled Transuranic and Transuranic Mixed Waste

Approximately 11,630 m³ of RH_TRU_TRUM waste will be shipped to the SWOC over the next 30 years. The minimum and maximum amounts that could be shipped are 13,730 m³ and 10,350 m³, respectively. The primary RH_TRU_TRUM physical waste forms are displayed in Figure 4-6. As depicted, 56% of the RH_TRU_TRUM baseline waste will be metal debris. Another 20% of the waste does not have physical waste form data available; 4% is expected to be combustible debris; and the remaining 20% will be other physical waste forms.

Figure 4-7 displays the baseline volume annually by physical waste forms. The large amount of held waste is forecasted by the PUREX tunnels, which currently does not have a shipping schedule for this waste. From 1996 through 2003, very little RH_TRU_TRUM is expected. Then from 2004 through

Table 4-1. CH_TRU_TRUM Waste Generators by Physical Waste Form^(a,b)

(a) Sum of individual values may not match totals due to rounding.					
(b) Amounts reported in cubic meters.

Figure 4-6. RH_TRU_TRUM Baseline Volumes by Physical Waste Form

Figure 4-7. Annual RH_TRU_TRUM Baseline Volume by Physical Waste Form

2012, small amounts (approximately 100 m³) will be generated. From 2013 through 2022, large amounts of metal debris will be generated due to the expected schedule for D&D of the PFP.

The waste generators for RH_TRU_TRUM that forecast the primary physical waste forms are shown in Table 4-2. The D&D of PFP will generate 66% of the metal debris. The only generator that was unable to provide physical waste form data for their RH_TRU_TRUM waste was the PUREX tunnels. The principal generator of combustible debris is the High-Level Vitrification Plant.

4.3 TRU_TRUM WASTE CATEGORIES BY HAZARDOUS WASTE CONSTITUENTS

A description of the CH_TRU_TRUM waste and RH_TRU_TRUM waste by the hazardous constituents that contaminate the waste is included below. Although TRU_TRUM waste is combined as one waste category, the hazardous constituents describe only the volumes of TRUM waste, since hazardous constituent data are not applicable to mixed TRU waste.

4.3.1 Contact-Handled Transuranic Mixed Waste

The baseline volume of CH_TRUM to be shipped to the SWOC in the next 30 years is approximately 14,760 m³, with the minimum and maximum ranges reported

Table 4-2. RH_TRU_TRUM Waste Generators by Physical Waste Form^(a,b)

as 13,890 m³ and 15,710 m³, respectively. Figure 4-8 displays the baseline, minimum, and maximum waste volumes by hazardous waste constituents. As shown in the figure, a majority (68%) of the CH_TRUM baseline waste has no hazardous constituent data available. Nineteen percent of the waste is expected to be organics; 5% will be metals without mercury; and the remaining 7% will be made up of other hazardous waste constituents.

Figure 4-9 displays the annual baseline CH_TRUM volume by hazardous waste constituents. From 1995 through 2005, the annual volume remains below 50 m³. From 2006 through 2012, the volume increases to approximately 100 m³. The annual volume increases to 1,300 m³ from 2013 through 2022, an increase which corresponds to the expected schedule of the D&D of PFP. Since most of the hazardous constituent data for the D&D of PFP are not available, "unknown" predominates from 2013 through 2022.

Table 4-3 provides the main waste generators for each of the primary hazardous constituents that make up the CH_TRUM waste. D&D of the PFP is the only generator with unavailable data. The D&D of T Plant is the major generator of the CH_TRUM waste containing organics.

4.3.2 Remote-Handled Transuranic Mixed Waste

Approximately 5,200 m³ of RH_TRUM waste will be shipped to the SWOC over the next 30 years. The maximum range is 6,390 m³, and the minimum range is 4,520 m³. Figure 4-10 displays the baseline, maximum, and minimum volumes for RH_TRUM waste by the hazardous constituents that contaminate the waste. As

Figure 4-8. CH_TRUM Waste Volumes by Hazardous Waste Category

(a) Sum of individual values may not match totals due to rounding.					
(b) Amounts reported in cubic meters.

Figure 4-10. RH_TRUM Waste Volumes by Hazardous Waste Category

depicted, 53% of the RH_TRUM baseline waste does not have hazardous constituent data available. Metals without mercury account for 16%, organics for 15%, and other hazardous components, 16%.

Figure 4-11 displays the annual RH_TRUM volumes by hazardous waste constituents. Less than 50 m³ of RH_TRUM is expected annually from 1995 through 2003. From 2004 through 2009, there is an increase in waste volume that comprises mainly metals without mercury and other hazardous waste constituents that are generated by the High-Level Vitrification Project. In 2010, hazardous constituents that were not described will be generated by the Double-Shell Tank Retrieval. From 2013 through 2022, large amounts of waste with unknown hazardous constituents will be generated by the D&D of PFP.

Table 4-4 displays the waste generators of RH_TRUM waste by the major hazardous constituents that contaminate the waste. D&D of PFP has the largest volume of RH_TRUM waste that has unavailable hazardous constituent data. Metals without mercury are generated primarily by the High-Level Vitrification Project and Surplus Facilities. Organics are expected to be generated by the D&D of T Plant.

LOW-LEVEL WASTE

Intentionally Left Blank

APPENDIX A

LOW-LEVEL WASTE

This appendix provides low-level waste (LLW) volumes by physical waste form for both contact-handled (CH) and remote-handled (RH) categories of LLW, which are described below:

- **Contact-handled low-level waste (CH_LLW):** This waste has a dose rate less than or equal to 200 mrem/h at contact with the waste container. The waste contains radioactivity that is not classified as transuranic waste, radioactive mixed waste, or spent nuclear fuel. The concentration of transuranic radionuclides is less than or equal to 100 nCi/g of the waste matrix.
- **Remote-handled low-level waste (RH_LLW):** This waste has a dose rate greater than 200 mrem/h at contact with the waste container. The waste contains radioactivity that is not classified as transuranic waste, radioactive mixed waste, or spent nuclear fuel. The concentration of transuranic radionuclides is less than or equal to 100 nCi/g of the waste matrix.

Hazardous waste constituent data will not be described, since LLW does not have hazardous constituents; only low-level mixed waste, which is described in Section 3.0 of the main report, contains hazardous constituents. The major generators of LLW will also be provided in this appendix; however, a detailed discussion of the associated waste generator missions is contained in Valero et al. (1995). LLW will not be handled by the SWOC except for selective sampling. Current plans are to send the majority of the LLW directly to the Hanford LLW burial grounds.

A.1 LOW-LEVEL WASTE VOLUME

Approximately 1,461,580 m³ of LLW is expected at the Hanford Site over the next 30 years. Of this waste, 96% is CH_LLW, and the remaining 4% is RH_LLW, as depicted in Figure A-1. Figure A-1 also displays the expected maximum and minimum waste volumes, 1,594,180 m³ and 1,381,860 m³, respectively. Figure A-2 displays the annual baseline volume of LLW by waste category. As depicted in the figure, waste volumes gradually increase from 2002 through 2007, when they peak at approximately 210,000 m³. This peak corresponds to the anticipated shipping schedule of Surplus Facilities.

Figure A-3 displays the major waste generators of LLW. Seventy-six percent will be generated by Surplus Facilities; the Formerly Utilized Sites Remedial Action Program (FUSRAP) will generate 4%; D&D of B Plant will generate 3%; and the remaining 17% will be generated by other miscellaneous waste generators.

Figure A-1. Total LLW Volume by Waste Category

Figure A-2. Annual LLW Baseline Volume by Waste Category

A.2 LOW-LEVEL WASTE CATEGORIES BY PHYSICAL WASTE FORM

This section describes the LLW volumes by waste category and physical waste form. The total volume and the annual volume by physical waste form are discussed. The major waste generators for each waste category are also provided.

Figure A-3. Major LLW Generators

A.2.1 Contact-Handled Low-Level Waste

The total baseline amount of CH_LLW to be shipped to the Hanford Site over the next 30 years is 1,403,200 m³. Figure A-4 displays the baseline, maximum, and minimum volumes of CH_LLW by physical waste form. The maximum and minimum expected volumes are 1,532,370 m³ and 1,325,770 m³, respectively. As depicted in the figure, inorganic non-metal debris will make up the largest (57%) portion of CH_LLW; contaminated soil will be 13%; metal debris and inorganic absorbed liquid/sludges will each be 7%; and other physical waste forms will constitute 15% of the CH_LLW.

Figure A-5 displays the annual CH_LLW baseline volumes by physical waste form. As shown in the figure, there is a gradual increase in waste from 2002 through 2007. This peak represents the shipping schedule of inorganic non-metal debris by Surplus Facilities.

The waste generators for CH_LLW by major physical waste form are displayed in Table A-1. Surplus Facilities is the major waste generator of CH_LLW and the primary generator of all major CH_LLW physical waste forms except metal debris. FUSRAP generates primarily inorganic non-metal debris, and the D&D of B Plant will mainly generate metal debris.

A.2.2 Remote-Handled Low-Level Waste

The total baseline amount of RH_LLW to be shipped to the Hanford Site over the next 30 years is 58,390 m³. The maximum and minimum expected volumes are 61,800 m³ and 56,090 m³, respectively. Figure 4-6 displays the baseline, maximum, and minimum volumes by physical waste forms. As depicted, inorganic

and organic absorbed liquid/sludges each will comprise 27% of the RH LLW. Metal debris will be 22%, inorganic non-metal debris will make up 16%, and other physical waste forms will be 8% of the RH LLW.

Figure A-7 displays the annual RH LLW baseline volume by physical waste form. The figure shows a peak from 2002 through 2009, which corresponds to the shipping schedule of absorbed liquid/sludges from the Surplus Facilities waste generator.

The waste generators for RH LLW by major physical waste forms are provided in Table A-2. Surplus Facilities will be the only producer of inorganic and organic absorbed liquid/sludges. Metal debris will be generated primarily by D&D of B Plant, and inorganic non-metal debris will be primarily generated by Surplus Facilities.
