7. Abstract

Historical Tank Content Estimate of the Southeast Quadrant provides historical evaluations on a tank by tank basis of the radioactive mixed wastes stored in the underground double-shell tanks of the Hanford 200 East and West Areas. This report summarizes historical information such as waste history, temperature profiles, psychrometric data, tank integrity, inventory estimates and tank level history on a tank by tank basis. Tank Farm aerial photos and in-tank photos of each tank are provided. A brief description of instrumentation methods used for waste tank surveillance are included. Components of the data management effort, such as Waste Status and Transaction Record Summary, Tank Layer Model, Supernatant Mixing Model, Defined Waste Types, and Inventory Estimates which generate these tank content estimates, are also given in this report.

ACKNOWLEDGMENTS

A project of the this magnitude would not be possible without the help of a significant number of persons and organizations.

ICF Kaiser Hanford Company would like to acknowledge the contributions made by our Los Alamos National Laboratory counterparts: Stephen F. Agnew, Kenn Jurgensen, Rob Corbin, Toma Duran, and Bonnie Young. Also, Todd Brown and Brett Simpson of Westinghouse Hanford Company are recognized for their contributions.

INTRODUCTION

THIS PAGE INTENTIONALLY
LEFT BLANK

1.0 Introduction

1.1 Purpose

The purpose of this historical characterization document is to present the synthesized summaries and evaluations of the historical records concerning the physical, radiological, and chemical composition of mixed wastes stored in underground double-shell tanks and the physical conditions of these tanks. The double-shell tanks are located on the Department of Energy Hanford Site, approximately 25 miles northwest of Richland, Washington. The document will be used to assist in characterizing the waste in the tanks after the current program of sampling and analyzing the tank wastes is completed. A historical review of the tanks may reveal anomalies or unusual contents that could be critical to characterization and post characterization activities.

This report was developed by reviewing the operating plant process histories, waste transfer data, and available physical and chemical data from numerous resources. These resources were generated by numerous contractors from 1945 to the present.

Waste characterization, the process of describing the character or quality of a waste, is required by Federal law (Resource Conservation and Recovery Act) and state law (Washington Administrative Code (WAC) 173-303, Dangerous Waste Regulations). Characterizing the waste is necessary for determining methods to safely retrieve, transport, and/or treat the wastes.

This document is not intended to be used as a total design basis document. Further field investigations of the information may be required before using this data for design purposes or safety analysis.

1.2 Scope

The scope of this document covers available information about the wastes contained in the double-shell tanks in the AP Tank Farm. Waste transfer and level data, tank physical information, temperature data, and sampling data have been compiled for this report. A summary of this information is contained in the "Historical Tank Content Estimate for the Southeast Quadrant of the Hanford 200 Areas" (WHC-SD-WM-ER-350). The southeast quadrant document contains all six of the double-shell tank farms. Five tank farms, AN, AP, AW, AY, and AZ, are located in the 200-East Area and are shown on the map in Figure 1. SY Tank Farm, located in the 200-West Area shown in Figure 2, was included in the southeast quadrant because of its double-shell tank construction.

The six tank farms in the southeast quadrant contain 28 tanks: AN Tank Farm (seven 1,160,000-gallon tanks), AP Tank Farm (eight 1,160,000-gallon tanks), AW Tank Farm (six 1,160,000-gallon tanks), AY Tank Farm (two 1,000,000-gallon tanks), AZ Tank Farm (two 1,000,000-gallon tanks), and SY Tank Farm (three 1,160,000-gallon tanks). Double-shell tanks are constructed of a primary carbon steel

cylinder and base inside a secondary carbon steel liner. The secondary liner is encased in a reinforced concrete shell and both liners are covered by a reinforced concrete dome. Depending on the farm, the tops of the tanks are buried between six and eight feet below grade.

1.3 Approach

This report was compiled from work performed by ICF Kaiser Hanford Company, Los Alamos National Laboratory, and Westinghouse Hanford Company.

ICF Kaiser Hanford Company reviewed the historical records of the tanks in each of the four quadrants and incorporated the inventory estimates and models of tank layers being developed by Los Alamos National Laboratory into the report.

1.3.1 Surveillance Techniques for the Hanford Mixed Waste Storage Tanks

Surveillance information (e.g., temperatures, waste surface levels, psychrometric data) is used to determine the physical condition of the tanks and the waste. Tank integrity (i.e., whether assumed as sound, assumed leaker, assumed re-leaker) is investigated by monitoring waste levels and the leak detection pits. Waste temperatures can be used to calculate the heat load of heat-generating radionuclides such as cesium 137 (^{137}Cs) and strontium 91 (^{91}Sr). The instrumentation and methods used for tank surveillance are described in the following sections.

■ Waste Surface Levels

Four types of liquid level devices are used to monitor liquid levels in the primary tank of a double-shell tank: a level indicating transmitter or Food Instrument Corporation gauge, a level indicator assembly or manual tape, a high-level detector (an FIC gauge in intrusion mode), and the ENRAF® 854 ATG liquid level indicator/transmitter. A level indicator assembly or manual tape is used to measure liquid levels in the annulus.

The Food Instrument Corporation gauge is used as the primary liquid level monitoring device with the manual tape as a backup in the primary tank. The high-level detector is used to detect intrusions (i.e., any unexplained addition to the tank like rainwater) within the primary tank. The Food Instrument Corporation gauge consists of an electrode and steel tape that detects liquid on contact. The instruments are scanned hourly on the computer automated surveillance system (CASS). Daily at 7:00 a.m., the automatic FIC reading is loaded on the Surveillance Automated Computer System (SACS). Manual FIC readings are taken at any time of day and are manually entered into the SACS.

FIGURE 2

The manual tape flake boxes are used as an access point for measuring liquid levels manually if the automatic system fails or does not exist in the primary tank. A hand crank on the flake box is used to lower the tape probe until liquid is contacted and a liquid level measurement can be obtained (this is similar to the FIC gauge). The flake boxes located over the annulus can be used to lower manual tapes into the annulus to measure any liquid (condensate or leakage from the primary tank) if present.

The ENRAF® 854 Liquid Level Indicator/Transmitter has been installed on several tanks and will eventually replace the old level measurement devices. The ENRAF® 854 ATG is a microprocessor controlled surface level gauge. Level detection is based on the principle of buoyancy of a non-floating polyethylene displacer. The displacer is attached to a stainless steel measuring wire. The measuring wire is attached to a measuring drum which is fixed to a riser of known elevation. The weight of the displacer is entered into the memory of a force transducer. A second weight of about 10-15 grams less than the actual weight of the displacer is entered into the transducer as the control point. An electronic servomechanism turns the measuring drum causing the displacer to move. As the displacer is put in contact with the surface in question, the displacer will exert a smaller force on the transducer due to buoyancy. The displacer is continually lowered until the force exerted on the transducer is equal to the control point. By knowing the elevations of the riser and tank bottom, and the distance from the riser to the surface of the waste, the surface level of the waste can be determined. If the surface level changes, the displacer will be raised or lowered by the measuring drum depending on the force exerted on the transducer relative to the control point. The measurements are recorded by the Tank Monitoring and Control System (TMACS). Daily at 12:00 a.m., the ENRAF® reading is loaded on the SACS.

Sludge levels are determined with a sludge measurement device which consists of a "doughnut" shaped weight attached to a steel tape. The sludge measurement device is lowered into the tank until it stops. Several risers are used to determine the approximate levels of the sludge below the liquid waste.

■ Interstitial Liquid Level (Liquid Observation Wells)

The interstitial liquid is the liquid within and underneath the solid waste. Wells to monitor the levels of interstitial liquid were installed only in Tanks 241-SY-102 and 241-AW-103. Gamma, neutron, and acoustic probes may be lowered into the wells to determine the interstitial liquid levels.

■ Temperatures

The temperatures of the double-shell tanks are monitored with thermocouples. A typical double-shell tank contains approximately 100 thermocouples at a variety of locations including the structural concrete of the tank foundation, walls, and dome; the tank knuckle region; the insulating concrete in the base; the primary steel liner; and the tank waste and vapor space. The aging waste tanks (AY and AZ Tank Farms) have thermocouples in their airlift circulators.

Thermocouples in the waste are attached to a fabricated assembly called a thermocouple tree. The number of thermocouples on a tree varies between tanks with 18 being the most prevalent. The thermocouples are spaced along the tree so that a temperature profile can be developed. Recently, multi-functional instrument trees (MIT) have been installed into a few of the watch list tanks (Tanks 241-SY-101 and 241-SY-103). These trees measure other properties, such as gas pressure and hydrogen concentration in the vapor space, in addition to the temperature. An MIT contains 22 thermocouples. Details on the status of the thermocouples as of April 1993 can be found in the "Thermocouple Status, Single Shell and Double Shell Waste Tanks" (Tran 1993).

The temperatures are recorded either manually on data sheets using a portable potentiometer or by one of several computer-automated systems. These systems include the computer automated surveillance system (CASS), the tank monitor and control system (TMACS), and the data acquisition and control system (DACS). These systems record other data besides temperatures. The surveillance analysis computer system (SACS) is the primary database for storing tank temperature data. The CASS and TMACS record temperatures on some single-shell tanks and double-shell tanks. The DACS only records temperatures in Tank 241-SY-101. In the past, the CASS has recorded temperatures of all double-shell tanks, but it presently records temperatures for the AP Tank farm only. The CASS stores temperature data on magnetic tape. The TMACS presently records temperatures for the AN and SY Tank Farms, but it is planned to operate for all tank farms by September 1996. The TMACS transfers its daily temperature readings to the SACS. Operators manually record temperatures on data sheets for the AP, AW, AY, and AZ Tank Farms. For the AP and AW Tank Farms, the temperatures from data sheets are manually entered into the SACS. The SACS database does not presently store temperature data for the AY and AZ Tank Farms.

■ Annulus

The double-shell tanks are designed so that if a leak develops in the primary tank shell, the leak can be detected in the annulus, the space between the steel liners. The annulus monitoring equipment includes a conductivity probe to detect the presence of liquids, a continuous air monitor (CAM) to monitor the level of radiation, and thermocouples to detect an increase in temperature. Either the conductivity probe or the CAM can be inoperable for up to ten days. There is a forced ventilation system for each annulus to aid in heat transfer from the primary tank and containment of waste should a leak in the primary tank occur. A grid of drain channels in the basal concrete collect any leakage and direct it to the leak detection pit. Photographs were taken inside the annulus for inspection purposes.

■ Leak Detection Pits

Leak detection pits are located next to the tank. Three instruments are used in these pits: a liquid level detector, a thermocouple, and a radiation monitor. The liquid level detector used is a specific gravity dip tube. The dip tubes need to be checked for accuracy periodically; therefore, a 6-inch water level is maintained in the bottom of the 24-inch leak detection pit to allow

for continuous checking. A thermocouple is placed at the bottom of the pit to detect an increase in temperature from any leaking heat generating radionuclides. A drywell next to the leak detection pit contains a radiation monitoring device to determine background radiation levels and detect leaks.

■ Ventilation

The ventilation for the primary tank and the annulus is filtered through high-efficiency particulate air (HEPA) filters and monitored continuously for anomalies. All the double-shell tanks are actively ventilated to prevent radioactive releases to the environment. Because the ventilation creates negative pressure in the primary tank, the negative pressure is monitored in the primary tank to prevent the tank bottom from buckling. The annulus vacuum or negative pressure is also monitored for changes that indicate a tank leak or system problems.

Since differential pressure is related to air flow in the tank, differential pressure readings are taken at the exhaust fans, filters, and deentrainers. The vapor space and atmospheric pressures are monitored and compared. High differential pressures are caused by filter plugging or wet filters, while low differential pressure can be caused by filter seal problems or tank pressurization. Continuous monitoring exists for radiation levels at various locations along the ventilation system.

■ Interior Tank Pressures

The double shell tanks have certain limiting factors to maintain each tank for its full design life. One limiting factor is tank pressure. The safety limits for pressures vary with the design of the tank, but all double-shell tanks have an operating pressure between -4 and 0 inches of water gauge (-0.14 psig or -1 kPa gauge and 0 psig or 0 kPa gauge). The pressure is recorded on continuous strip charts. Refer to the occurrence sections on tank farms and tanks in this document for details on the frequency and duration of the tanks pressurizing.

■ Evaporation Rate (Psychrometrics)

Psychrometric data are collected on all the double-shell tanks and high-heat load single-shell tanks. The data are obtained from air moving through the inside of each tank and the annulus. The schedule for obtaining psychrometric data is determined by Westinghouse Hanford Company Process Engineering. Presently, data are recorded about once a month.

The main reason for recording psychrometric data is to determine the rate of evaporation in the tanks. The evaporation rates can be used to account for loss of liquid from the tanks. The data collected in the annulus are used to quantify the moisture content of the air in the annulus. The psychrometric data can also be used to estimate the instantaneous rate of heat transfer into the ventilation systems of the tank and the annulus.

Five pieces of information are required to calculate the evaporation rates and heat exchange in the tank: the wet-bulb and

dry-bulb temperatures of air entering the tank, the wet-bulb and dry-bulb temperatures of air leaving the tank, and the volumetric flow rate of air moving through the tank.

Dry-bulb temperatures are obtained using a standard thermometer. Wet-bulb temperatures are measured by a thermometer having the bulb covered by a cotton wick saturated with water. When the wet wick is placed in the air stream, some of the water in the wick is evaporated. As a result, the temperature of the water decreases. The heat loss from the water by evaporation equals the heat gain from the air, and the water temperature stabilizes. This stabilized temperature is the wet-bulb temperature.

Once the wet-bulb and dry-bulb temperatures are known, the properties (enthalpy, relative humidity, specific volume, and humidity ratio) of air at the tank entrance and exit can be determined. By comparing the properties of air at these points, the amount of water added and heat transferred to or from the air stream can be determined.

The raw data have always been measured and recorded in the field. However, methods of calculating the evaporation rate and heat transfer rate have differed. Evaporation rates and heat transfer rates were calculated using a program on a Hewlett Packard Calculator from the time data were first recorded (1977) to 1989. From 1989 until the present, the raw data were entered into a computer spreadsheet (Microsoft® Excel) and the evaporation rate and heat transfer rate were automatically calculated. The program was modified to represent more accurately the calculations made by the American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc. The main difference is that the density of water is now fit to a curve as a function of temperature to approximate a mass to volume conversion. These calculations have been documented and checked (Wood 1993).

■ In-Tank Photography

In-tank photography is another method used to determine the volume of waste. Photographs are used to resolve anomalous measurements inside the tanks and to assist in determining tank integrity. Photographs can also be used to determine sludge and liquid levels, provide a degree of corroboration with other waste monitoring techniques, and be a source of information about foreign objects contained in the tanks. The photographs can be compared to see if wastes in tanks with similar histories have similar characteristics. Currently, photographs are not used to determine waste levels in double-shell tanks because none are leaking.

1.3.2 Approach and Development of Supporting Information Contained in the Historical Tank Content Estimate and Supporting Documents

Extensive historical information was gathered for each tank. This document contains a comprehensive data set on each tank. The data are summarized in the Historical Tank Content Estimate.

■ Tank Level Histories

The tank level histories graphically represent waste levels over the lifetime of a tank. They include information such as waste types, in-tank photograph dates, transfer data, and physical data. Information was gathered from various documents and the resulting data, commentary, and dates were delineated on each drawing.

The liquid and solids levels on the tank level history graphs are based on waste volumes. The levels are calculated from the volumes and depicted in height above the bottom of the tank (see Appendix C). The sources of waste volume information include the "Tank Farm Surveillance and Waste Status Summary Reports" (Hanlon 1989 to 1993) and "A History of the 200 Areas Tank Farms" (Anderson 1990). The following formula was used to convert the waste volumes (total gallons) to the respective waste surface levels (total inches) for all tanks in the double-shell tank farms:

FORMULA

$$\frac{\text{Total Gallons}}{2750 \frac{\text{Gallons}}{\text{Inch}}} = \text{Total Inches} \quad (1)$$

■ Temperature Data

The sources of the historical temperatures presented here are the computer automated surveillance system (CASS), the surveillance analysis computer system (SACS), and manually recorded data sheets. The data from these sources span from July 1981 to June 1995 for all double-shell tanks. The CASS stored daily temperature readings for all double-shell tank farms on magnetic tapes. This system stored temperatures for most tank thermocouples (e.g., those in the foundation, walls, primary liner, etc.); however, only data from thermocouples inside the tank are presented in this report. The CASS occasionally stored an error code in place of a daily temperature for any errors that the system was programmed to recognize. These codes were removed from the data set before any data were processed. The SACS stored internal temperature readings for all farms except the AY and AZ Tank Farms. This system stored temperature readings for some subset of the internal thermocouples for a given double-shell tank. The temperature data from the SACS are available through the PC SACS software on the Hanford Local Area Network. Daily temperature readings for the AZ Tank Farm were obtained from data sheets in late 1989 and early 1990.

The data from the CASS, the SACS, and the data sheets were imported into Microsoft® Excel spreadsheets, then reviewed for suspect data points. Each data set was divided for this review into subsets of suspect and non-suspect temperatures. Because the full temperature data set was extremely large for each tank farm, each non-suspect subset was further reduced by extracting the weekly maximum temperature from the set. However, the full data set was presented for the two tanks in the AZ Tank Farm due to the large

temperature fluctuations measured in these tanks. The integration of the weekly maximum temperature set and the suspect temperature set is tabulated in Appendix D. For thermocouples with large amounts of suspect data, weekly temperatures were extracted in the same manner. Temperature history plots were developed for most of the thermocouples. A plot was not created for a thermocouple with five or less data points available. A discontinuity in the temperature plot represents a hiatus of greater than three years between two sequential data points. A straight line is used to connect sequential data points spanning less than three years. Linear regressions were performed on the temperature plots within Microsoft® Excel to quantify the temperature trend within an individual tank. Other statistics such as the mean, maximum, and minimum temperatures were also determined for each tank (see individual tank sections). The statistics are a function of the non-suspect temperature subset before being reduced to a set of weekly maximums.

The naming convention used for the thermocouples in this report follows that used by the thermocouple status report (Tran 1993). For example, according to Tran, the name of the topmost thermocouple on the tree in Tank 241-AP-101 is TE-101-AP-36. The computer automated surveillance system (CASS) generally uses this naming convention. The CASS excludes the name of the tank farm from the thermocouple name (e.g., TE-101-36) for some tank farms. The surveillance analysis computer system (SACS) uses a positive integer to identify the in-tank thermocouples (typically, 1 through 18 for an 18-element thermocouple tree). Tran also identifies thermocouples with a positive integer (e.g., TE-101-AP-36 is thermocouple 1). Using the two sets of thermocouple names provided by Tran, the data from the CASS were matched with the data from the SACS for each thermocouple.

■ Surface Level Plots

The data recorded from January 1, 1991 to June 30, 1995 for the waste surface levels were obtained from the Westinghouse Hanford Company surveillance analysis computer system (SACS). PC SACS is the user interface to the SACS database on a personal computer. The information was parsed in a spreadsheet (Microsoft® Excel) and graphed to show waste level versus time. There is a separate graph for the data from each type of measuring instrument. However, data from the manual FIC and automatic FIC gauges are shown together on the graphs with the heading FIC. Current information on the waste surface levels is in Appendix E.

■ Tank Profiles and Other Drawings

The drawings in this report were compiled from several sources including as-built drawings and the "Double-Shell Underground Waste Storage Tanks Riser Survey" (Anderson 1992). The risers and other penetrations through the tank dome serve several purposes including points of access for monitoring equipment and sampling the waste.

■ Photographs

The latest tank interior and tank farm aerial photographs were obtained from Pacific Northwest Laboratory and are in Appendix I. The tank farm aerial photographs were labeled to indicate the relative position of each tank in the farm. Larger equipment was

labeled in the photographs. Photographs of tank interiors have been arranged to show the contents of each tank. The auxiliary equipment shown on each photographic montage was identified if possible and labeled.

■ Historical Sample Analysis Data

The sampling data were obtained from the Westinghouse Hanford Company Tank Waste and Retrieval Group. Tables of analytical data were made for samples taken prior to September 1989. The information was compiled in the Microsoft® Excel computer program to present the data as similarly as possible. The tables include physical data, chemical analysis data by component, and radiological analysis data by component. Other data included with the sample references are summarized as text. Tank historical sample analysis data are in Appendix H.

■ Psychrometric Plots

The psychrometric data were obtained from both the manually recorded and electronic records of the Westinghouse Hanford Company Tank Farm Surveillance Group. All the data were entered into computer spreadsheets (Microsoft® Excel) and the latest program (Wood 1993) was used to calculate evaporation rates and heat transfer rates. These quantities have been plotted against time on separate graphs (see Appendix F). Evaporation rate versus time was plotted in both gallons per week and inches per week for the tanks. Evaporation rate is used to show the amount of water removed from the tank. Heat transfer rates were plotted in Btu/hr.

The heat generated in the waste is dispersed into the environment through the ventilation systems of the tank and annulus, through the tank walls into the soil, and through other types of heat loss. The major portion of the heat exchanged with the environment occurs through the ventilation systems. By plotting the rate of heat exchange between the waste and the ventilation systems and reviewing the respective trends in conjunction with the flow rates and ambient temperatures, trends were calculated for the heat generation rate of the waste.

1.3.3 Approach and Development of the Process-Based Historical Tank Content Estimate

The historical characterization inventory estimates of tank contents using process-based historical data, presented in this report, were developed by Los Alamos National Laboratory (S.F. Agnew et al.). The historical estimates are the primary sources of data to characterize tank contents until the tank characterization reports are completed. These reports will incorporate the results of current core sampling and analyses with the historical inventory estimates to present the most current evaluation of waste constituents.

Generating tank content estimates based on historical information involves managing and evaluating large quantities of data. The system of generating the estimates is composed of several parts that are described in the following sections.

■ Waste Status and Transaction Record Summary

The waste status and transaction record summary (i.e., transaction summary) contains all known waste transfer records. Historically, when waste was pumped from plant (process) to tank or tank to tank, a record was kept of the volume and type of waste that was pumped. The transaction summary contains the recorded levels of the solids and supernatant.

The transaction summary is partitioned into four separate sections (i.e., quadrants). The development method of the database, the strategies of subsequent data sets, and the data for the southeast quadrant are in the "Waste Status and Transaction Record Summary for the Southeast Quadrant" (Agnew 1995).

■ Defined Waste Types

Early in the development of the historical tank content estimates, a need to compile the chemical compositions of all known waste types into one reference document was recognized. The information was compiled by Los Alamos National Laboratory. The Hanford defined wastes document was developed independently of the waste status and transaction record summary and the tank layer model. However, the Hanford defined waste list was used with the model to obtain the tank waste inventory estimates described below.

The Hanford defined wastes document contains the compositions and physical properties for all known types of Hanford waste that were sent to the double-shell and single-shell tanks. For more details on the methods used to develop these waste types, refer to "Hanford Defined Wastes: Chemical and Radionuclide Compositions" (Agnew 1994).

■ Tank Layer Model

The tank layer model is derived from the waste status and transaction record summary. The purpose of the model is to predict the waste types and solids volumes in each tank. The model is generated by reconciling the reported levels of solids from each tank in the transaction summary with the volume percent of solids expected for the primary additions of waste. The transaction summary contains records of the types of waste that entered each tank and the corresponding increase in the solids volume from each waste entry. Not all transactions that occurred were recorded in the transaction summary because records were lost and transfers were unrecorded or mis-recorded. However, the tank layer model is representative of the waste because two crucial pieces of information required for the inventory estimates are well represented; the primary waste additions and measurements of solids levels.

The tank layer model associates a solids volume percent with each waste type. The solids volume percent was derived by comparing the observed change in the solids volume with the primary additions recorded in the waste status and transaction record summary. In waste types that lacked an adequate number of solids measurements to develop a solids volume percent, a nominal value was assigned based on similarity to other waste types that had adequate data. If the predicted volume percent solids was different from the measured

volume, the difference was indicated as an unknown gain or loss of solids for the tank. The unknown losses and gains were designated unknown layers and were assigned to a best estimate defined waste type when possible for the composite inventory estimates. Layers that were not assigned a best estimate waste type were not included in the composite tank estimates. The unknown layers were depicted on the tank layer model graphs but the volume of the unknown layers was assigned to the supernatant volume and not included as a volume in the solids inventory estimate.

A layer "set" in the tank is assumed not to move or change volume. The layers are presented in chronological order from the bottom of the tank to the top. Lateral variations were not accounted for and only average layer thickness can be derived from the model.

There are two main sources for variations in the solids volume percent in a single waste type. First, there is an inherent variability in the process stream as the process evolves. Second, solids can be added to or removed from a tank by inadvertent entrainment during supernatant transfers. In addition to these sources of variation, there are a number of other minor sources of solids changes such as compaction, subsidence, and dissolution of soluble salts by later additions.

Diatomaceous earth and cement were added to immobilize residual supernatant in tanks where pumping the liquid was not feasible. The conversion factor in the tank layer model is 160 gal/ton for diatomaceous earth and 120 gal/ton for cement. Cement and diatomaceous earth are not included in the composite inventory estimates.

It was assumed that any solids that accumulated were saltcake or salt slurry from the time a tank became a "bottoms" receiver to the end of the evaporator campaign. Saltcake can be any one of seven different types depending on which evaporator campaign created it. For saltcake accumulation, it was assumed that all of the solids reported were saltcake. The results of the model are presented graphically with the inventory estimate in Appendix K.

■ Supernatant Mixing Model

Los Alamos National Laboratory developed the supernatant mixing model that describes a "supernatant" portion of each tank as a combination of Hanford defined waste supernatants that have been concentrated by some factor (see Appendix K). The following fundamental criteria were used for this model:

- 1) Ideal mixing of the total volume of each tank throughout its history was assumed (i.e., no excluded volume for remaining solids layers).
- 2) Transactions were added to the waste status and transaction record summary to resolve unknown transactions for each quarter according to a set of rules. Therefore, an updated transaction summary was used that will be published later.

3) Not all of the saltwell liquid sources for 1978 through 1995 are known. All unknown saltwell liquid is now assigned to water for this estimate.

■ Inventory Estimates

The end result of combining the information from the tank layer model, the supernatant mixing model, and the Hanford defined wastes document is the tank inventory estimate (see Figure 3). When the volumes and compositions of each waste type in a particular tank are determined from the various sources of information, the total chemical inventory in the tank is calculated.

Figure 3. Schematic of Inventory Estimate Strategy.

The tank inventories used data from the Tank Farm Surveillance and Waste Status Summary Reports (Hanlon 1993). The inventories represent the estimated contents of the tanks as of January 1, 1994. The results for individual tanks are presented in tabular form and tanks that have unassigned waste layers are indicated.

The inventory estimates developed by Los Alamos National Laboratory were checked for accuracy against existing data from current sample analyses, thermal and physical models, and historical records. When the checking process reveals discrepancies between the estimates and the existing data, the models may be reevaluated. Thus, the process of generating estimates will be iterated and the associated errors will be reduced over time as knowledge of the tank waste operations increases.

1.3.4 Assumptions

The quality of the historical information available for the tanks often requires assumptions and judgements on the applicability and validity of the data. Some assumptions were used to interpret the data.

■ Temperature Data

All the temperature data obtained by ICF Kaiser Hanford Company were reviewed for suspect data points. Data that deviated from expected trends were marked as suspect and comments added accordingly. Suspect data points satisfied one of the following criteria: 1) a temperature less than 20°F, 2) a large scatter in temperatures from one day to the next over a continuous period of time, 3) an individual temperature reading not following the trend of other temperatures recorded during the same period, 4) disagreement between an individual thermocouple reading and the reading of thermocouples located above and below it on the tree, or 5) disagreement between data recorded at the same time from the CASS, the SACS, and/or manually recorded data sheets. All temperatures less than 20°F were removed from the data set and do not appear in the tables in Appendix D. Temperatures that deviated more than 15 percent from the data trend were assumed to be suspect from criterion 3 above. A clear indication that the data acquisition system recording the temperatures was in error was that the suspect data points were repeated concurrently for other tanks in the same farm. This behavior occurred in data from the CASS.

The instrumentation allowing manual recording of temperatures on data sheets is assumed to be calibrated the same as the instrumentation used by the CASS and the tank monitor and control system.

■ Sampling Data

When the sampling data were compiled, a sample was considered to be a solids sample if it contained greater than 30% solids.

■ Psychrometric Plots

Psychrometric data are collected randomly once a month. The data from air entering the tank would not always be collected at the

same time as the data from air exiting the tank. Therefore, the calculated evaporation rate and heat transfer rates may not truly represent the monthly, weekly, or daily average. The data represent only one point per month. By combining all these points, a trend is assumed to exist for each tank.

The program used to calculate evaporation rates contains some assumptions. The liquid waste temperature is assumed to be the same temperature as the outlet dry-bulb temperature in order to convert the mass of liquid in the air stream into a volume equivalent (gallons/week). Standing liquid is assumed to exist in order to convert the volume equivalent evaporation rate into a liquid level evaporation rate (inches/week).

■ Inventory Estimates

The result of combining the information from the tank layer model, the supernatant mixing model, and the Hanford defined wastes document is the tank inventory estimate. Waste stream compositions (Hanford defined wastes) were based on process flowsheet information and previous analytical data. The assumptions for the other precursors to the inventory estimates are described below.

Tank Layer Model

The formation of solids in the wastes varied by type and was determined individually by examination of the historical fill records. The volume of solids determined must conform to physically attainable systems (e.g., waste volumes contained in the tanks do not exceed the tank capacity and negative void fractions are not possible).

The solids were assumed to be evenly distributed throughout the slurry during their transfer. In the tank layer model, the distribution of solids is chronological and volumetric, but does not attempt to predict the solids stratigraphy (configuration of layers). Localized mounding and pocketing in various areas of the tank may have occurred due to phenomena around the inlets and outlets (e.g., transfers through pumps removing or depositing sludge). These phenomena would have affected only a small fraction of the tank area and do not impact the overall results of this study. However, spatial variability within the physical configuration and process history is acknowledged. No method is currently available that would adequately model this discrepancy. An effort is underway to develop this concept further and incorporate it into the tank characterization process, but it is incomplete at this time.

Solids from a specifically designated waste type are assumed to be homogeneous. Variation and layering of the sludge due to differences in component concentration between batches, precipitate particle size, and particle density were quite likely. The effect of these factors on the distribution of components within the solids is unknown. However, the effect was assumed to be small and not detectable with the present sample collection and analysis process.

Solids were not assumed to be compacted; therefore, compaction was not accounted for in the study. Although compaction probably

occurred in the history of the tanks because additional layers of solids formed atop each other, the degree of compression is unknown and, therefore, was not incorporated.

Density and other physical characteristics of the solids were determined from individual waste types using available information (e.g., process flowsheets), or were based on approximate physical analogues.

The capacity of each tank was assumed to never have been exceeded during transfers. Tank capacity is dependent on fill status, fill order, and tank type.

Tank transfers were assumed to be normally free of particulates. Therefore, the majority of solids were confined to their initial receiver tanks and were not sent to cribs or transferred extensively between tanks. This assumption was based on the following assumptions. The pumping equipment typically was not designed to transfer substantial quantities of solids (except when sluicing or specifically transferring solids). Monitors on the crib discharge lines would have indicated significant solids contamination, and the tank farm operating procedures would have prevented discharging solids to the ground.

Supernatant Mixing Model

Los Alamos National Laboratory developed the supernatant mixing model that describes a "supernatant" portion of each tank as a combination of Hanford defined waste supernatants that have been concentrated by some factor (see Appendix K). The following assumptions were used for this model:

- 1) Ideal mixing of the total volume of each tank throughout its history was assumed (i.e., no excluded volume for remaining solids layers).
- 2) Transactions were added to the waste status and transaction record summary to resolve unknown transactions for each quarter according to a set of rules. Therefore, an updated transaction summary was used that will be published later.
- 3) Not all of the saltwell liquid sources for 1978 through 1995 are known. All unknown saltwell liquid is now assigned to water for this estimate.

1.4 Historical Information Quality

The quality of information compiled for this report varied greatly. Some data came from published documentation. Other data were retrieved electronically from various Westinghouse Hanford Company databases. The quality of data used in the estimates is described in the following section.

■ Waste (Level) Histories

The waste history narrative contains a general description of the waste types contained in a specific tank from receipt of the

first waste transferred to the present. The current status of the tank is also presented. The history is not designed to be a detailed summary of every waste type and transaction for a tank. The waste types are general and are usually given only for transactions of sufficient volume to significantly impact the total volume of the tank (e.g., a transaction that increased the waste volume by 3,000 gallons in a tank originally containing a waste volume of 6,000 gallons would be considered significant. The same amount added to a tank containing 600,000 gallons of waste would not be considered significant.). For a more complete record of transactions and types of wastes involved, refer to the "Waste Status and Transaction Record Summary for the Southeast Quadrant" (Agnew 1995).

The accuracy of the tank waste histories relies on the completeness of the Westinghouse Hanford Company document "A History of the 200 Area Tank Farms" (Anderson 1990); the monthly Westinghouse Hanford Company, Atlantic Richfield Hanford Company, and Rockwell Hanford Operations waste summary reports; and the "Waste Status and Transaction Record Summary for the Southeast Quadrant" (Agnew 1995).

Surface level readings may be affected by plummet (e.g., manual tape) error, flushing water accumulation, waste surface irregularities, and gas generation. Crystalline wastes (i.e., saltcake) can build up on the end of the plummet gradually and contact the waste which indicates a false surface level increase. Significant level discrepancies occur when the buildup breaks off or when the measuring instrument plummet is flushed to remove the saltcake buildups. Flushing the Food Instrument Corporation gauge, manual tapes, or any other equipment may cause accumulated wash water to collect under the plummet which indicates a false increase in the overall volume of waste within the tank. Surface level readings are often difficult to obtain from tanks with a relatively dry saltcake surface. Some tanks have crystalline buildup on internal tank equipment (i.e., pumps, thermocouples, and other protruding equipment). As the supernatant is pumped from the tanks, the crystalline structure may remain attached to the equipment and be suspended above the liquid. Therefore, an accurate surface level measurement would be difficult if the breakup of the crystalline structure was inconsistent and a nonuniform waste surface was created. Steel tapes that are bent or warped from operation or those discarded on the waste surface are other sources of altered surface level readings.

■ Temperature Data

The quality of data from the computer automated surveillance system (CASS), surveillance analysis computer system (SACS), and manually recorded data sheets has not been verified. One exception is the subset of data from the SACS that had been reviewed. Engineering judgement formed the basis of removing suspect data from the original data set to produce a set of non-suspect data.

In the temperature tables of Appendix D, suspect data are labeled S, transcribed data are labeled T, and good data are labeled G. This quality indicator is used by the custodians of the SACS. The labels S and G both indicate that a review has taken place

(either by the SACS custodians or during creation of this report). Only data already labeled transcribed (T) and good (G) were retrieved from SACS. If interpreted as suspect during the compilation of this report, the data from SACS that originally were labeled T or G were relabeled with an S or S (G in SACS), respectively. Otherwise, the data retained the original label. Data from the CASS or the data sheets were labeled with a T when retrieved for this report, assuming such data had never been reviewed previously. If interpreted as suspect during the compilation of this report, the data from the CASS and data sheets were relabeled with an S; otherwise, the label remained T.

■ Surface Level Data

Data from the surveillance analysis computer system (SACS) were obtained electronically from the Westinghouse Hanford Company surveillance group and were plotted. The data are actual surface levels recorded from the surveillance equipment. If the surveillance equipment in a particular tank riser was removed from service, the readings may show a level change when a new instrument and/or riser is used, especially if the waste surface shows severe heterogeneity.

The data used to produce the plots and the data obtained from the surveillance group have been verified as identical. However, errors in the data prior to the exchange of information could still exist. The SACS data were understood to be unverified prior to the exchange. Westinghouse Hanford Company qualified the data with G, S, T for good, suspect, and transcribed, respectively. The criteria for determining these qualities are unknown.

■ Riser Configuration

The riser configurations are based on the design drawings and engineering change notices dated before August 3, 1995. The riser configuration document (WHC-SD-RE-TI-093, Rev. 3) was used as a guide; however, the design drawings and engineering change notices take precedence. The tables in Appendix G contain a riser number, diameter, and description of each riser and nozzle. A brief explanation and date of the pertaining engineering change notice, if applicable, is in parentheses under the description and comments heading for each riser. Available risers are labeled spare and do not have any attached equipment; this includes observation ports.

■ Photographs

The photographic montages were made from the latest available photographs of the tank interiors and are in Appendix I. In some tanks, photographs have not been taken since the early 1970's. Some tanks had fogging problems in the vapor space which prevented use of the latest photographs. Sometimes, reviewing the older photographs was useful to determine changes in waste volume or equipment. Montages made from older photographs may not be indicative of current tank contents, especially if the tank had been pumped since the last time a photograph was taken.

■ Psychrometric Data

The psychrometric data obtained from Westinghouse Hanford Company came from sheets of manually recorded data before 1989 and

computer files after 1989. Agreement between the raw data obtained from Westinghouse Hanford Company and the psychrometric plots has been checked. However, errors in the data prior to the exchange of information may still exist.

The raw data could contain errors. The inlet (ambient) conditions could have been measured when the operators first entered the farm and not immediately before the outlet measurements of each tank were taken. The volumetric flow rate is measured using a pitot tube. As the flow rate decreases, the pitot tube measurements become less accurate. Minter (1994) demonstrated a high degree of uncertainty in determining changes in moisture content as air passed through a primary tank and annulus. Even though Minter (1994) discusses uncertainties with Tank 241-C-106 (a single-shell tank), some of the same principles and errors exist in the data obtained from the double-shell tanks. Dodd (1994) suggested that collecting psychrometric data should cease for tank annuli until more rigorous examinations determined whether collecting the data was worthwhile.

Other limitations, besides the fact that the calculated data represent only one recorded data point per month, should be considered before drawing any conclusions about the data. The heat transfer rate only expresses heat transferred to or from the air stream; it does not include other methods of heat transfer such as conduction through the soil or radiant heat transfer. Floating objects or a surface crust could exist in the tank which would change the surface area available for evaporation and possibly change the temperature of the liquid.

When the raw data varied from certain physical laws, the data were labeled suspect and were not included in the graphs. The data point was labeled suspect if the wet-bulb temperature was greater than the corresponding dry-bulb temperature or if the flow rate was extremely high compared to the rest of the data. A brief explanation of why the data point was labeled suspect is in the comment column of Appendix F. Data labeled as suspect may vary between the originally labeled data from Westinghouse Hanford Company and the data after review during the creation of the supporting documents.

■ Historical Sample Analysis Data

The historical sample analysis data refer only to information obtained before September 1989 (see Appendix H). The data (results from analyzing the samples and details about the samples) have not been validated by the characterization program. When validated, the data will be reissued in a later revision of the Historical Tank Content Estimate report and supporting documentation. The sample data often were retrieved from memoranda indicating the results of the sample analysis. The analytical methods, holding times, quality control information, and location at which the sample was taken were not provided. The scope of analysis frequently was quite narrow which limited the available data set. However, the data sets are the only available historical information on chemical characterization.

The data obtained from the sample analysis records vary widely in type, quality, and scope. The data range from a process control

analysis (e.g., checking the plutonium separation process by analyzing a grab sample for a few selected components) to a total characterization suite performed on a core sample. There are no specific criteria for determining quantitative data quality for the information incorporated into the Supporting Document. The information sources were assessed to determine if the samples were from the waste in the tank. The available data were assessed for suitability and consistency with this report and selected information was incorporated.

1.5 Southeast Quadrant Background

The double-shell tanks were built between 1968 and 1986 to provide interim storage for high-level nuclear wastes. Processes such as plutonium separation from spent nuclear fuel and uranium metal recovery generated the millions of gallons of mixed (radioactive and hazardous) waste stored within these tanks.

The most common waste stored in the tanks in the southeast quadrant is dilute waste. However, many tanks in the quadrant currently store wastes from the Plutonium Finishing Plant process and other onsite separation processes. Much of the waste is scheduled for concentration in the 242-A Evaporator.

1.5.1 Waste Generating Plants and Processes

Although not all of the processes listed below contributed waste directly to tanks in the southeast quadrant, the waste they generated could have been transferred indirectly tank-to-tank. The plants and processes that generated waste now contained in the single-shell and double-shell tanks are presented in chronological order. Typically, the name of the plant and the process are synonymous.

■ T Plant

T Plant was the first full-scale separations plant at Hanford. It was constructed between June 1943 and October 1944 and was used as a separations facility for irradiated production reactor fuel until 1956. T Plant was designed to separate plutonium from uranium and the bulk of fission products in irradiated fuel through the bismuth phosphate separations process. The 224 (Concentration) Building, adjacent to T Plant, was part of this process. Since 1957, T Plant has been used as a facility for repair and decontamination of equipment. The facility was modified in 1978 to store pressurized water reactor (PWR) core II fuel assemblies. T Plant facilities have been used for repairing, testing, shipping, decontaminating, decommissioning, and storing contaminated tools and equipment from locations both onsite and offsite.

The following wastes were sent to the tank farms: metal waste (MW), decontamination waste (DW), first-cycle decontamination waste (1C), second-cycle decontamination waste (2C), and 224 waste.

■ B Plant

B Plant was constructed between August 1943 and February 1945 and was used for the bismuth phosphate process until 1952. B Plant

was designed to use the same bismuth phosphate separations process that was used at T Plant. This process used both bismuth phosphate and lanthanum fluoride. The 224 (Concentration) Building, adjacent to B Plant, was part of this process. In 1968, B Plant became a waste fractionation plant after it was modified to remove ^{137}Cs and ^{90}Sr from PUREX acid waste, high-level supernatant, and sludge from self-boiling liquid wastes.

The following B Plant wastes were sent to the tanks: B Plant high-level waste (B), B Plant flush waste water (BFSH), B Plant low-level waste (BL), complexant concentrate (CC or CCPL), complexed waste (CPLX), fission product waste (FP), metal waste (MW), REDOX ion exchange waste processed at B Plant (RIX), ion exchange waste (IX), strontium sludge (SRS), cell 5 tank 6 waste (5-6), first-cycle decontamination waste (1C), second-cycle decontamination waste (2C), and 224 waste.

■ Bismuth Phosphate Process

B Plant and T Plant used the bismuth phosphate extraction process to remove plutonium from uranium fuel elements. The 224 Buildings were also part of this process. The waste that resulted was a metal waste (MW) that still contained 90% of the fission products and 99% of the original uranium. The MW was sent to specific tank cascades in the 200-East and 200-West Areas. First-cycle decontamination waste (1C), second-cycle decontamination waste (2C), and 224 waste were also stored in other underground waste tanks in the 200 Areas.

■ Plutonium Finishing Plant

The Plutonium Finishing Plant (PFP) or Z Plant, previously called Plutonium Recovery and Finishing Operations, began operating in late 1949 to process plutonium and prepare plutonium products. The PFP operations included plutonium handling, plutonium reclamation, plutonium conversion, decontamination, and decommissioning.

Waste from the Plutonium Reclamation Facility (near PFP) and Z waste from the remote mechanical "C" line process were sent to tanks.

■ Uranium Oxide Plant

The 224-U Building was completed in 1944 as part of the U Plant complex. The building was converted to a uranium oxide (UO_3) plant in 1951. The 224-UA Building was constructed in 1957 with six installed calciners. The UO_3 plant was capable of handling the uranyl nitrate hexahydrate (UNH) stream from REDOX, U Plant, and PUREX. The UO_3 plant was shut down in 1972 but restarted in 1984 with the feed lines from REDOX and the U Plant canyon disconnected. Since 1984, there have been 17 campaigns at the plant averaging eight days each. The plant can calcine UNH much faster than it is produced by the PUREX plant. Final deactivation was ordered for the plants in 1992. In April 1993, the UO_3 plant resumed operations to convert 200,000 gallons of remaining UNH to uranium oxide powder. A final deactivation plan for the facility was prepared in the summer of 1993 and will be carried out in the next few years.

■ REDOX

The Reduction and Oxidation extraction (REDOX) plant was built between May 1950 and August 1951 and operated until July 1967. Uranium and plutonium were extracted from solid uranium metal slugs that were irradiated in the Hanford reactors or piles. Uranium and plutonium were extracted with methyl isobutyl ketone (hexone) solvent in a continuous solvent extraction process. The REDOX process was the first at Hanford to recover both plutonium and uranium.

The following wastes were sent to the tank farms: REDOX process waste resulting from the dissolution of aluminum and zircaloy fuel element cladding, REDOX coating waste (CWR), REDOX waste (R), the supernatant portion of waste generated by the REDOX process, and REDOX supernatant (RSN). RSN is found above the sludge in the underground storage tanks that received waste from REDOX.

■ U Plant

U Plant (221-U) was built as one of three original bismuth phosphate process facilities, but it was not used for that purpose. U Plant was modified extensively and used for the uranium recovery process, operating from 1952 to 1958. The main canyon at U Plant currently stores failed equipment.

Uranium in waste from the BiPO_4 process initially was stored in the single-shell tanks. Later, the waste was sluiced, dissolved in nitric acid, and processed through a solvent extraction process to recover the uranium. The process yielded approximately 1.4 gallons of UR waste for every gallon of metal waste originally stored. The increase in waste volume made developing technology to reduce the volume of stored waste a priority. This need resulted in developing and implementing the ferrocyanide scavenging process.

The waste sent to the tanks from U Plant was called tributyl phosphate (TBP) even though it contained very little TBP. Therefore, to eliminate confusion, the waste will be referred to as uranium recovery (UR) waste in this report.

■ Strontium Semiworks

The Strontium or Hot Semiworks facility (i.e., C Plant) was built in 1949 as a hot pilot plant for the REDOX process but was converted to a pilot plant for the PUREX process. In 1960, the plant was reactivated and used as a process demonstration for the conversion of B Plant to a waste fractionation facility. The plant was used to recover ^{90}Sr , promethium 147 (^{147}Pm), and ^{144}Cs from PUREX waste. The building and the site have been decontaminated and decommissioned.

Waste sent from the Strontium Semiworks to the tank farms was known as hot semiworks (HS), strontium semiworks (SSW), and fission product waste (FP).

■ PUREX

The process used in the Plutonium Uranium Extraction (PUREX) plant (i.e., A Plant) was an advanced solvent extraction method using tributyl phosphate in a paraffin hydrocarbon solvent to recover

uranium and plutonium from nitric acid solutions of irradiated uranium. The PUREX plant, built between April 1953 and April 1955, operated until 1972 when it was closed for 11 years. Two thorium campaigns were conducted between 1966 and 1971. The irradiated waste was similar to the PUREX waste, but it contained thorium and uranium 233 rather than uranium and plutonium found in typical PUREX waste. The PUREX plant was restarted in November 1983 but was shut down in 1988 after a safety violation. It was shut down several times between 1988 and 1990 for various reasons. In October 1990, the plant was put on standby and was identified for closure in December 1992 by Secretary of Energy James Watkins.

The following PUREX wastes were sent to the tank farms: cladding (coating) waste (CW or CWP), organic wash waste (OWW), neutralized PUREX acid waste (P), low-level waste from PUREX (PL), PUREX sludge supernatant liquid (PSS), organic wash waste (CARB), cesium feed (CF), and inorganic wash waste (IWW).

1.5.2 Waste Management Operations

This section describes the different methods used to concentrate waste in the 200 Area. Evaporating, concentrating, and scavenging are all methods used to reduce liquid volumes or precipitate solids out of supernatant. The operations are presented in chronological order.

■ 242-T Evaporator

The 242-T Evaporator was built in the early 1950's to reclaim nonboiling waste storage capacity in existing tanks. The evaporator was shut down in the summer of 1955 and modified for tributyl phosphate scavenging, although scavenging was never performed in this evaporator. The evaporator was restarted in 1965 and operated until 1976. Tank 241-TX-118 was the feed tank for this evaporator.

The following wastes were sent from the 242-T Evaporator to the tanks: slurry product from the evaporator bottoms (EB), evaporator feed (EF), and terminal liquor (TL).

■ 242-B Evaporator

The 242-B Evaporator, south of the B Tank Farm, started operating in December 1951. It received feed waste until November 1954, was shutdown in September 1955, and was never reactivated. Tanks 241-B-106 and -105 were used as the feed tank and bottoms tank, respectively. The evaporator operated at atmospheric pressure.

■ Ferrocyanide Scavenging

Ferrocyanide scavenging was developed to reduce waste volumes. The ferrocyanide flowsheet was first tested in U Plant in October 1953, and in-farm scavenging was completed in March 1956 and December 1957 for the 200-West and 200-East Areas, respectively. The ferrocyanide scavenging program was designed to remove fission products such as ^{137}Cs (half life = 28.6 yr) and ^{90}Sr (half life = 30.2 yr) from the uranium recovery and 1C wastes as a precipitate. After the ^{137}Cs and ^{90}Sr precipitates settled, the clarified supernatant was sampled and disposed of in cribs.

■ In-Tank Solidification

The primary function of the in-tank solidification systems was to concentrate the nonboiling waste directly inside of specially designed tanks. These tanks produced a saltcake slurry. Each system included a heat exchanger for water evaporation and a series of bottoms tanks. The first in-tank solidification unit (ITS #1) operated with an airlift circulator through Tank 241-BY-102, and the second in-tank solidification unit (ITS #2) operated with a similar circulator through Tank 241-BY-112. Tank 241-BY-112 also contained a 4,000 kW electric immersion heater. Tank 241-BY-101 contained an in-tank solidification prototype that was used for demonstration purposes only. In-tank solidification units 1 and 2 began operating in 1965 and 1968, respectively. In 1971, ITS #1 became the cooler for ITS #2. Both units were shut down in 1974.

■ REDOX Concentrator

The REDOX concentrator was used to reduce the volume of dilute 200-West Area tank farm wastes by removing water. The concentrator received tank farm wastes from July 28, 1967 until June 30, 1972. Cell D in the REDOX process was the concentration and neutralization section of the plant.

■ 242-S Evaporator-Crystallizer

The 242-S Evaporator-Crystallizer began operating in November 1973 and was shut down in 1981. It was designed as a reduced pressure (i.e., partial vacuum) evaporator-crystallizer. Aqueous salt wastes were converted in the evaporator to salt crystals for storage in underground tanks in the S and SX Tank Farms.

The following waste types were sent to the tanks from the 242-S Evaporator: noncomplexed waste concentrated until the solution was nearly saturated with sodium aluminate known as double-shell slurry feed (DSSF), slurry product from the evaporator bottoms (EB), evaporator feed (EF), Hanford defense residual liquor (HDRL), partially neutralized feed waste (PNF), and terminal liquor (TL).

■ 242-A Evaporator-Crystallizer

The 242-A Evaporator-Crystallizer was constructed in 1976 and began operating in March 1977 with a design life of ten years. In 1987, design changes were developed to extend the facility's operating life by ten years. The evaporator was shut down in April 1989 because of regulatory issues, but was restarted in May 1994 after extensive modifications.

The following wastes were sent to the tanks: B Plant low-level evaporator bottoms (BLEB), double-shell slurry feed (DSSF), evaporator feed (EF or EVAP), evaporator bottoms (EB), and terminal liquor (TL).

1.5.3 Miscellaneous Waste Sources and Equipment

Wastes from various other sources on the Hanford Site have been added to the tanks. Some wastes are from the 300 Area, 100 Area production reactors, various laboratories, and catch tanks. Unique contents added to single-shell tanks included laboratory wastes;

diatomaceous earth; Portland cement; shroud tubes; ceramic balls; experimental fuel elements; and relatively small amounts of enriched uranium, plutonium, cobalt; and natural uranium.

The following wastes were added to the tanks: Hanford defense residual liquor (HDRL), Hanford laboratory operations waste (HLO), water (H₂O), N Reactor waste (N) from phosphate decontamination process, and noncomplexed waste (NCPL).

■ Critical Mass Lab

The critical mass lab was used to develop data on the factors necessary to make a criticality or self-sustained nuclear reaction occur. Because plutonium was the key radioactive element on the Hanford Site, the research was based on plutonium criticality safety in various fuel cycles. The facility was located next to the Strontium Semiworks and ran from the early 1950's to the early 1980's. The plutonium used in the lab was reprocessed in PUREX.

■ 244-AR, -BXR, and -CR Process Vaults

The three process vaults in the northeast quadrant are the 244-AR Vault, the 244-BXR Vault, and the 244-CR Vault. These vaults were composed of several process vessels or tanks used to prepare the waste for treatment or storage. Specific wastes from tanks can be pumped temporarily to the vaults and later sent directly to desired tanks or processing facilities.

The AR Vault was designed and constructed between 1964 and 1968 and is located next to the A and AX Tank Farms. The AR Vault has been on standby since 1978.

The 244-BXR Vault is located south of the BX Tank Farm and was constructed between 1950 and 1951. The BXR Vault began operating in 1952 and became inactive in 1956. The waste in the vault was difficult to handle, so the vault was jetted with high-pressure steam in 1976. The vault was interimly isolated after 1976 and interimly stabilized in March 1985. Tank BXR-004 was removed in 1963.

The 244-CR Vault was constructed in 1952 and is located next to the C Tank Farm. Saltwell waste from the C Tank Farm is interimly stored in the CR Vault. The 244-BXR and -CR Vaults were originally constructed to aid in the recovery of uranium from bismuth phosphate metal waste. The CR Vault received waste from the Strontium Semiworks Plant en route to the C Tank Farm.

■ 204-AR and 204-S Railroad Car Facilities

The 204-AR rail car unloading facility was built in 1981 and replaced the 204-S rail car unloading facility. The facilities were built for unloading tank cars containing radioactive liquid waste. Liquids or slurries from the 1314-N Building in the 100 Area and the 340 Building in the 300 Area are unloaded at the 204-AR unloading facility.

1.5.4 Timelines

Timelines are presented on the following pages that represent the different events that occurred during the lifetime of major Hanford plants and tank farms in the 200-East and 200-West Areas. The plants and associated processes were the main contributors to the waste currently contained in the tanks. The following is a list of abbreviations used in the timelines [Figures 4 (A and B) and 5 (A-C)] and their corresponding meanings. Abbreviations in parentheses are wastes that are listed in Appendix A.

PUREX: Plutonium uranium extraction process
UO₃: Uranium trioxide
PFP: Plutonium Finishing Plant
RG-RB: Rubber glove - remote button line
RMA: Remote mechanical "A" line
RSE: Recuplex solvent extraction
RMC: Remote mechanical "C" line
PRF: Plutonium Reclamation Facility
PCB: Polychlorinated biphenyls
WESF: Waste Encapsulation and Storage Facility
ITS: In-tank solidification (units #1 and #2)
PWR: Pressurized water reactor
REDOX: Reduction oxidation process

1.6 Safety Issues

The safety issues that affect the tanks can be divided into two groups: watch list and non-watch list. The watch lists are a listing of all tanks that are believed to pose potential safety hazards to the environment and the public. Non-watch list issues are of concern because they may impact the environment.

1.6.1 Watch List Safety Issues

Safety issues for these tanks were identified as "issues/situations that contain most necessary conditions that could lead to worker (onsite) or offsite radiation exposure through an uncontrolled release of fission products" under Public Law 101-510, Section 3137, of the National Defense Authorization Act of Fiscal Year 1991 (i.e., the Wyden Amendment). As of November 1993, 45 single-shell tanks and 6 double-shell tanks are on a watch list. All 6 of the double-shell tanks are on the watch list for hydrogen or other flammable gas. The four watch list designations described in this report are ferrocyanide, hydrogen or other flammable gas, organic salts, and high-heat load. The following sections provide a general description and criteria of the different watch lists. For a more complete explanation, refer to the Hanford Site Tank Farm Facilities Interim Safety Basis (WHC 1993).

■ Ferrocyanide

A tank containing or believed to contain greater than 1,000 gram moles of ferrocyanide (dry basis) is on the ferrocyanide watch list. Tanks containing ferrocyanide are potentially explosive if ferrocyanide and nitrates combine.

■ Hydrogen or Other Flammable Gas

Tanks were placed on this watch list due to the potential of containing flammable gas rather than the verified presence of hazardous concentrations. Tanks on the watch list for hydrogen or other flammable gas have been identified as an unreviewed safety question due to the concern that burning flammable gas could result in a radiological release.

■ Organic Salts

Tanks containing or believed to contain more than the equivalent of 10% by weight of sodium acetate or 3 wt% total organic carbon (TOC) on a dry basis received a watch list designation as in the "Tank Farm Surveillance and Waste Status Summary Report" (Hanlon 1993). Tanks containing organic salts could release waste if an uncontrolled increase in temperature or pressure results from oxidation by nitrates and nitrites.

■ High-Heat Load

Tanks with a heat load greater than 40,000 Btu/hr are designated as high-heat load tanks. Tank 241-C-106 is the only high-heat load tank on the high-heat load watch list.

Any tank not listed on the high-heat load tank list or the high-heat load watch list with a heat load less than 40,000 Btu/hr is considered a low-heat load tank by default.

The following table lists the tanks in the southeast quadrant that appeared on the watch list as of June 1995. A current listing is published monthly in the "Tank Farm Surveillance and Waste Status Summary Report".

Southeast Quadrant Double-Shell Watch List Tanks

DST Tank	Category
241-AN-103	Hydrogen
241-AN-104	Hydrogen
241-AN-105	Hydrogen
241-AW-101	Hydrogen
241-SY-101	Hydrogen
241-SY-103	Hydrogen

1.6.2 Non-Watch List Safety Issues

Tank leaks are a safety hazard because of the potential to release chemicals and radioactive liquids to the ground. Corrosion is the main cause of tank leaks. Three other safety issues that do not require a watch list and continual monitoring under the Wyden Amendment include criticality, tank bumps, and toxic vapor releases.

■ Corrosion

Corrosion is a localized or general reduction in the thickness of the carbon steel liner. Localized reduction in the liner thickness is one of three types of corrosion: pitting corrosion, stress corrosion cracking, and crevice corrosion. General reduction in liner thickness may be uniform corrosion.

The tanks are equipped with corrosion (cathodic) protection. None of the double-shell tanks are assumed or confirmed leaking.

■ Criticality

Criticality is a self-sustained, nuclear chain reaction. Studies have concluded that a nuclear criticality accident in the tank farms is probably not an imminent risk. However, knowledge of the inventory of fissile material and its distribution within the tanks is incomplete. Therefore, criticality remains a safety issue. The key radionuclide on the Hanford Site that would be involved in a criticality accident is plutonium. To prevent a criticality, a maximum content of 125 kg of fissile material has been specified for the tanks. An unusual occurrence report involving nuclear criticality was filed in June 1991 for Tank 241-C-104. Later, an inventory of 56 kg was calculated which indicated a low probability

for criticality. Criticality is considered an unreviewed safety question, but is not affected by the Wyden Amendment according to the Hanford Site Tank Farm Facilities Interim Safety Basis (WHC 1993).

■ Tank Bumps

Tank bumps have been an issue at Hanford since 1953 with the last bump occurring in 1968. Tank bumps occur when heat from the hotter solid waste in the lower portion of the tank is suddenly transferred to a near boiling supernatant. Mixing can be achieved by "roll over" or sudden restart of airlift circulators which results in rapid fluid vaporization and a sudden internal tank pressurization that causes a bump. The three documented bumps that have occurred were due to airlift circulator failure followed by rapid startup of the airlift circulators which causes rapid mixing. Two key factors have been identified to control bumping: liquid and solid temperatures must be maintained as far away from the local boiling point as possible, and airlift circulators and ventilation systems must be operated as designed. A tank bump is extremely unlikely if airlift circulators and vent flowrates are maintained at 500 to 1,000 ft³/min per tank and 50 ft³/min to the airlift circulators according to the Hanford Site Tank Farm Facilities Interim Safety Basis (WHC 1993).

■ Toxic Vapor Releases

Toxic vapor releases are a recently analyzed safety concern at Hanford. Odors have been released from the C Tank Farm in the northeast quadrant and from Tank 241-SY-101 in the southeast quadrant. The entire issue of toxic gas releases at the tank farms has just begun to be understood according to the Hanford Site Tank Farm Facilities Interim Safety Basis (WHC 1993).

1.7 Occurrences

Over the years, unusual events that occurred at the Hanford Site have been documented by various reporting methods. Some of these reports include unusual occurrences reports, off normal reports, event fact sheets and occurrence reports. According to these reports, four unusual events affected all of the tank farms included in the southeastern quadrant. Occurrence reports RL--WHC-Tank Farm-1993-0072, RL--WHC-Tank Farm-1992-0028, RL--WHC-Tank Farm-1991-1031, and RL--WHC-Tank Farm-1991-1026 were written due to loss of power in the area. For more information on occurrences, refer to the Farm Information section for the specific tank.

FARM INFORMATION

**THIS PAGE INTENTIONALLY
LEFT BLANK**

2.0 AP Tank Farm

2.0.1 AP Tank Farm History

The AP Tank Farm is located south of 4th Street and east of Canton Avenue on the eastern side of the 200-East Area. The farm contains eight 75-foot diameter, 1,160,000-gallon capacity (1,140,000-gallon operating limit) double-shell tanks. The tanks are described as double-shell because of their two steel liners. The tanks were constructed with a primary steel liner (stress-relieved carbon steel), a secondary steel liner, and a reinforced concrete shell with an insulating concrete foundation between the primary and secondary liners (see tank cross-section in Appendix G). These tanks were designed to hold concentrated supernatant. The maximum design temperature for liquid storage is 300°F. The tanks are all at the same elevation with no cascade lines between the tanks.

A color aerial photograph taken in 1993 of the AP Tank Farm shows the orientation of the tanks, leak detection pits, annulus ventilation equipment, air intake stations, and a valve pit (see Appendix I).

2.0.1.1 AP Tank Farm Waste History

The tanks in the AP Tank Farm began receiving waste in July 1986. The first wastes consisted of non-complexed waste, Hanford Site facilities waste, and double-shell slurry waste. Low-level waste from PUREX was sent to Tanks 241-AP-101, -102, -103, -107, and -108 from 1987 to 1992. Tank 241-AP-104 received N Reactor decontamination waste in 1987. Tanks 241-AN-102 and -104 were feed tanks for the grout facility. Presently, only Tanks 241-AN-101, -107, and -108 are active, and they are dilute process feed tanks to the 242-A Evaporator.

2.0.1.2 AP Tank Farm Temperature History

The eight tanks within the AP Tank Farm each contain one thermocouple tree with 18 thermocouples at known elevations. The thermocouple elevations on the tree range from six inches to 38.5 feet above the bottom of the tank. Each tree was installed in riser 4 during construction of the tanks. A tree is constructed from a capped 10-inch stainless steel pipe and a set of guide tubes, one to contain each thermocouple. Each guide tube allows access to replace a failed thermocouple. It appears that all trees are operating normally; none have needed repair or replacement.

All of the AP tanks have a requirement for temperatures to be recorded weekly. Data were available from the computer automated surveillance system (CASS) and the surveillance analysis computer system (SACS). The CASS is currently recording temperatures in the AP Tank Farm daily. Temperatures from manually recorded data sheets are currently entered weekly into the SACS database. See tables and graphs of temperature data in Appendix D.

There are two sets of equipment that compile and display temperature data in the AP Tank Farm, one for Tanks 241-AP-101 through 241-AP-104 and one for Tanks 241-AP-105 through 241-AP-108. The thermocouple leads from each set of four tanks enter each set of equipment which compiles the data and displays the temperatures on a monitor for manual recording on data sheets. The CASS receives the same data from this equipment that an operator would record on a data sheet. The temperature histories of Tanks 241-AP-105 through 241-AP-108 indicate a temperature rise on the same date in May 1994 that did not appear in the data from the other set of four tanks. An apparent malfunction between the point where the four leads from this set of tanks enter the compiling equipment and the final display of data probably caused this behavior. The lack of transfers to and from Tanks 241-AP-105 through 241-AP-108 eliminate transfers as the cause on the temperature rise (see surface level data in Appendix E). The reason behind the temperature increase is still under investigation. All temperature data for Tanks 241-AP-105 through 241-AP-108 after May 1994 are questionable.

2.0.1.3 AP Tank Farm Occurrences

Six unusual events occurred at the AP Tank Farm with one specific to Tank 241-AP-104. Since 1986 when the tanks began operating, the following five occurrences affected all eight tanks. Four occurrence reports were written because equipment failures caused the tanks to reach atmospheric pressure (occurrence reports RL--WHC-Tank Farm-1993-0049, RL--WHC-Tank Farm-1992-0055, RL--WHC-Tank Farm-1992-0019, and RL--WHC-Tank Farm-1991-0226). According to off-normal report 86-55 issued in December 1986, the tanks were pressurized from a power failure causing loss of ventilation.

2.0.1.4 AP Tank Farm Ventilation

Each tank in the AP tank farm is designed to have 146.25 standard cubic feet per minute (SCFM) of air travel through the tank and 1075 SCFM of air travel through the annulus. Air enters each tank by infiltrating around the pit cover blocks and leaves via riser 7. The air ducts for all of the tanks are joined and one fan sends air into the primary exhaust system. Before the tank air is released to the atmosphere the air is heated and routed through a prefilter and two high-efficiency particulate air (HEPA) filters. Each annulus receives supplied air after passing through a heater, a prefilter, and a HEPA filter. Air leaves each annulus through riser 9 and travels through the ducts to a common AP Tank Farm heater and two HEPA filters before it is released to the atmosphere. Both the tank and annulus systems have a primary and a backup system. For more information, refer to drawing H-2-90514, sheets 1 and 2.

The tanks in AP Tank Farm have a minimum and maximum safety limit pressure of -12 inches of water gauge (-0.43 psig or -2.99 kPa gauge) and 60 inches of water gauge (2.17 psig or 14.93 kPa gauge), respectively. The operating pressure is between -4 and 0 inches of water gauge (-0.14 psig or -1 kPa gauge and 0 psig or 0 kPa gauge). Each tanks exhaust ventilation system may be inoperable (potentially

pressurizing to 0 inches of water gauge) for less than 2 hours continuously or 40 hours in 12 months without exceeding safety limits. These limits can be found in document WHC-SD-WM-OSR-016, Rev. 0B (Heubach 1994).

The psychrometric data were prepared in two parts, the tank data and the annulus data. Positive numbers represent moisture and heat leaving the tank and annulus, and negative numbers represent moisture and heat entering the tank and annulus. Three plots were made for each of the tanks: evaporation in inches per week versus time, heat transfer rate to the ventilation system in BTU per hour versus time, and evaporation in gallons per week versus time. Two plots were made for each tank's annulus: heat transfer rate to the ventilation system versus time, and evaporation in gallons per week versus time. Evaporation in inches per week, though calculated, was not plotted because this data is significant only if standing water is present in the annulus. If there were insufficient raw data or the data point was labeled suspect, the point was not plotted on the graph. See Appendix F for the tables and plots.

2.0.1.5 AP Tank Farm Historical Sample Analysis Data

Samples were drawn from three tanks (241-AP-102, -103, and -104) and analyzed. The samples were similar in composition, containing primarily sodium phosphate and radionuclides of strontium and cobalt. The samples were yellow to a yellowish-brown with little or no solids. The remaining tanks have no historical sampling data. No information on sampling procedures and methods were available for the tanks (see Appendix H).

2.0.2 Current Status of AP Tank Farm

All tanks in AP Farm are active, actively ventilated and categorized as sound. Currently, the total waste volume is 2,207,000 gallons (Hanlon, June 1995).

2.0.2.1 AP Tank Farm Inventory Estimates

There are three inventory estimates for each tank in the AP Tank Farm created by Los Alamos National Laboratory (see Appendix J). The supernatant mixing model (SMM) composite estimate is based on the output of the supernatant mixing model. The tank layer model (TLM) solids composite estimate is based on the output of the tank layer model. The total inventory estimate is a combined volume weighted average of the SMM composite and the TLM composite inventory estimates.

2.0.2.2 Waste Volume Approximations AP Tank Farm

The waste volume approximations in each tank was modeled using two programs developed by Los Alamos National Laboratory (LANL). One program, the supernatant mixing model (SMM), modeled the liquid (supernatant) portion of the tank. The other program, the tank layer model (TLM), modeled the solids portion of the tank. The models were run using data representing the estimated contents of each tank as of

the inventory estimate date (January 1, 1994). Results from both models are in Appendix K.

The waste volume approximations have been modified in both programs and are presented on each level history sketch in Appendix C. There are two areas that have been modified. The first area concerns the concentrated supernatant solids (CS solids). The CS solids are determined by taking the difference between the measured solids volume and the solids volume predicted by the tank layer model. The concentrated supernatant solids are considered part of the total supernatant and not as a solid according to the tank layer model. The second area concerns the supernatant volume. The supernatant volume from LANL presented on the level history sketch was determined by taking the difference between the predicted supernatant mixing model volume and the CS solids volume. These modifications were necessary in order to reflect the actual supernatant and solids volumes that were measured within each tank.

2.0.2.3 AP Tank Farm In-Tank Photographs

Only the photograph of the AP Tank Farm is in Appendix I. There are no interior tank photographs available at this time.

2.1 Tank 241-AP-101

2.1.1 241-AP-101 Tank History

2.1.1.1 Waste History of Tank 241-AP-101

The history of the primary additions is derived from the "Waste Status and Transaction Record Summary for the Southeast Quadrant" (Agnew 1995). Tank 241-AP-101 received zircaloy cladding waste from PUREX during the third quarter of 1987. The tank had an unknown transaction during the third quarter of 1987. The tank received PUREX ammonia scrubber feed waste from the third quarter of 1988 until the fourth quarter of 1989.

The history of the waste types is derived from the Tank Farm Surveillance and Waste Status Summary Reports for January 1980 through March 1994. Tank 241-AP-101 began receiving non-complexed waste in July 1986 and continued to receive this waste until May 1990. From June 1990 until March 1994, the tank waste was designated as dilute non-complexed waste.

The tank is currently an active dilute receiver tank with waste being concentrated by the 242-A Evaporator. Sketch ES-TKS-E157, a graph representing the level history, and the historical waste level data used to generate the graph are in Appendix C.

2.1.1.2 Temperature History of Tank 241-AP-101

Temperatures from within Tank 241-AP-101 are recorded by 18 thermocouples. Non-suspect temperature data recorded between April 1986 and March 1995 for all 18 thermocouples were obtained from the computer automated surveillance system (CASS). Non-suspect temperature data taken between July 1989 and June 1995 for 12 of the thermocouples were obtained from the surveillance analysis computer system (SACS). However, not all of the 12 thermocouples have data covering that entire period. There were small breaks in the sequence of temperature data from each system. The average temperature during these periods was 60°F with a minimum of 48°F, a maximum of 81°F, and a standard deviation of 4.1°F. Linear regressions were performed on the data for each thermocouple with a resulting average decreasing slope of -0.0001°F/day. See tables and graphs of temperature data in Appendix D.

2.1.1.3 Occurrences of Tank 241-AP-101

No unusual events exclusively affected Tank 241-AP-101.

2.1.1.4 Psychrometrics of Tank 241-AP-101

Psychrometric data have been recorded for twelve years from the tank and six years from the annulus. The apparent trend (according to the plot in Appendix F) of the evaporation rate from the tank has decreased from an average of 76.7 gallons per week in May 1988 to an average of 48.3 gallons per week in January 1995. Over that same period, the trend in the rates of heat exchange through the primary

tank and annular ventilation has apparently decreased. A review of the psychrometric data from Tank 241-AP-101 suggests an overall decrease in the rate of heat generation by the waste.

2.1.1.5 Historical Sample Analysis Data for Tank 241-AP-101

No sampling data are available for this tank.

2.1.2 Current Status of Tank 241-AP-101

Tank 241-AP-101 was placed into service in October 1986 and currently stores approximately 78,000 gallons of waste (Hanlon, June 1995). The waste level in the tank is measured with a FIC gauge and a manual tape and has fluctuated between 385 inches and 54 inches. The increases were additions of waste from Tank 241-AP-108 in October 1994 and January 1995. The decreases came from transferring waste to Tank 241-AW-102 in October 1994. See Appendix E for details on waste surface level. This tank is active, actively ventilated, and categorized as sound. The waste is currently being concentrated by the 242-A Evaporator. A plan view in Appendix G depicts the riser locations as of August 3, 1995. Tank 241-AP-101 has 71 risers. Seven 4-inch risers (no. 15, no. 21, no. 24, three no. 27's, and no. 28), four 12-inch risers (no. 7, two no. 10's, and no. 12), two 24-inch risers (two no. 6's), and two 42-inch risers (two no. 5's) are available for use.

2.1.2.1 Inventory Estimate of Tank 241-AP-101

The three inventory estimates derived by the Los Alamos National Laboratory (LANL) predict the physical, chemical, and radiological constituents of the supernatant, the solids and the total volume for each tank. These estimates are presented in Appendix J.

2.1.2.2 Waste Volume Approximations for Tank 241-AP-101

The summary of approximated waste volumes, as derived from Los Alamos National Laboratory's supernatant mixing model (SMM) and tank layer model (TLM), are presented in Appendix K. The modeled volume is from the tank waste contents corresponding to the inventory estimate date of January 1, 1994. A tank cross-section that depicts the waste volume on the inventory estimate date is in Appendix G. The total waste volume on the inventory estimate date was approximately 1,060,000 gallons according to the Tank Farm Surveillance and Waste Summary Report (Hanlon 1993). The total waste volume was divided by the SMM and the TLM into the following subsets. The SMM predicted 1,060,000 gallons of supernatant. The TLM did not predict any solids within the tank.

2.1.2.3 In-Tank Photograph of Tank 241-AP-101

No interior tank photographs are available.

2.1.3 Synopsis of Tank 241-AP-101

(To be completed.)

2.2 Tank 241-AP-102

2.2.1 241-AP-102 Tank History

2.2.1.1 Waste History of Tank 241-AP-102

The history of the primary additions is derived from the "Waste Status and Transaction Record Summary for the Southeast Quadrant" (Agnew 1995). Tank 241-AP-102 received PUREX ammonia scrubber feed waste during the third and fourth quarters of 1989. The tank received four unknown transactions between the first quarter of 1991 and the third quarter of 1992.

The history of the waste types is derived from the Tank Farm Surveillance and Waste Status Summary Reports for January 1980 through March 1994. Tank 241-AP-102 began receiving Hanford facility waste in July 1986 and continued to receive this waste until May 1990. The tank waste was designated as dilute non-complexed waste from June 1990 until March 1994.

The tank is currently an inactive grout feed tank containing excess water from the grout facility. Sketch ES-TKS-E158, a graph representing the level history, and the historical waste level data used to generate the graph are in Appendix C.

2.2.1.2 Temperature History of Tank 241-AP-102

Temperatures from within Tank 241-AP-102 are recorded by 18 thermocouples. Non-suspect temperature data recorded between April 1986 and March 1995 for all 18 thermocouples were obtained from the computer automated surveillance system (CASS). Non-suspect temperature data taken between July 1989 and June 1995 for 12 of the thermocouples were obtained from the surveillance analysis computer system (SACS). However, not all of the 12 thermocouples have data covering that entire period. There were small breaks in the sequence of temperature data from each system. The average temperature during these periods was 67°F with a minimum of 30°F, a maximum of 90°F, and a standard deviation of 8.5°F. Linear regressions were performed on the data for each thermocouple with a resulting average increasing slope of 0.0045°F/day. See Appendix D for graphs and tables of temperature data.

2.2.1.3 Occurrences of Tank 241-AP-102

No unusual events concerned this tank since it went into service.

2.2.1.4 Psychrometrics of Tank 241-AP-102

Psychrometric data have been recorded from this tank and annulus for six years. The apparent trend (according to the plot in Appendix F) of the evaporation rate from the tank has decreased from an average of 63.4 gallons per week in May 1988 to an average of 49.3 gallons per week in January 1995. Over that same period, the trend in the rates of heat exchange through the primary tank ventilation

has decreased. The rates of heat exchange through the annular ventilation show an increasing trend. The majority of the changes in the rate of heat exchange can be attributed to changes in the average ventilation rates. A review of the psychrometric data in Tank 241-AP-102 suggests an increase in rate of heat generation by the waste.

2.2.1.5 Historical Sample Analysis Data for Tank 241-AP-102

A sample was drawn from Tank 241-AP-102 and analyzed on June 8, 1988 (see Appendix H). The sample was a phosphate and sulfate liquid waste sample. It was composed of primarily sodium and phosphorous cations and carbonate, phosphate and sulfate anions. The highest concentrations of radionuclides present were cobalt, cesium and strontium.

Information on sampling procedures and methods were not available.

2.2.2 Current Status of Tank 241-AP-102

Tank 241-AP-102 was placed into service in October 1986 and currently stores approximately 1,099,000 gallons of waste (Hanlon, June 1995). The waste level in the tank is measured with a FIC gauge and a manual tape and has increased from about 50 inches in January 1991 to 400 inches in January 1993. The increase was attributed to waste received from Tank 241-AN-106 between November 1992 and January 1993. See Appendix E for details on waste surface level. This tank is inactive at the present time. The tank is actively ventilated and categorized as sound. A plan view in Appendix G depicts the riser configuration as of August 3, 1995. Tank 241-AP-102 has 71 risers. Seven 4-inch risers (no. 15, no. 21, no. 24, three no. 27's, and no. 28), three 12-inch risers (no. 7, no. 10, and no. 12), two 24-inch risers (two no. 6's), and two 42-inch risers (two no. 5's) are available for use.

2.2.2.1 Inventory Estimate of Tank 241-AP-102

The three inventory estimates derived by the Los Alamos National Laboratory (LANL) predict the physical, chemical, and radiological constituents of the supernatant, the solids and the total volume for each tank. These estimates are presented in Appendix J.

2.2.2.2 Waste Volume Approximations for Tank 241-AP-102

The summary of approximated waste volumes, as derived from Los Alamos National Laboratory's supernatant mixing model (SMM) and tank layer model (TLM), are presented in Appendix K. The modeled volume is from the tank waste contents corresponding to the inventory estimate date of January 1, 1994. A tank cross-section that depicts the waste volume on the inventory estimate date is in Appendix G. The total waste volume on the inventory estimate date was approximately 1,104,000 gallons according to the Tank Farm Surveillance and Waste Summary Report (Hanlon 1993). The total waste volume was divided by the SMM and the TLM into the following subsets.

The SMM predicted 1,104,000 gallons of supernatant. The TLM did not predict any solids within the tank.

2.2.2.3 In-Tank Photograph of Tank 241-AP-102

No interior tank photographs are available.

2.2.3 Synopsis of Tank 241-AP-102

(To be completed.)

2.3 Tank 241-AP-103

2.3.1 241-AP-103 Tank History

2.3.1.1 Waste History of Tank 241-AP-103

The history of the primary additions is derived from the "Waste Status and Transaction Record Summary for the Southeast Quadrant" (Agnew 1995). Tank 241-AP-103 received PUREX ammonia scrubber feed waste from the first quarter until the third quarter of 1988.

The history of the waste types is derived from the Tank Farm Surveillance and Waste Status Summary Reports for January 1980 through March 1994. Tank 241-AP-103 began receiving non-complexed waste in July 1986 and continued to receive this waste until May 1990. From June 1990 until March 1994, the tank waste was designated as dilute non-complexed waste.

The tank is currently an inactive dilute receiver tank. Sketch ES-TKS-E159, a graph representing the level history, and the historical waste level data used to generate the graph are in Appendix C.

2.3.1.2 Temperature History of Tank 241-AP-103

Temperatures from within Tank 241-AP-103 are recorded by 18 thermocouples. Non-suspect temperature data recorded between April 1986 and March 1995 for all 18 thermocouples were obtained from the computer automated surveillance system (CASS). However, not all of the 18 thermocouples have data covering that entire period. Non-suspect temperature data taken between July 1989 and June 1995 for 9 of the thermocouples were obtained from the surveillance analysis computer system (SACS). However, not all of the 9 thermocouples have data covering that entire period. There were small breaks in the sequence of temperature data from each system. The average temperature during these periods was 62°F with a minimum of 50°F, a maximum of 76°F, and a standard deviation of 5.1°F. Linear regressions were performed on the data from 17 of the 18 thermocouples with a resulting average decreasing slope of -0.0020°F/day. One thermocouple's temperature data consistently disagreed with the trend of the rest and, subsequently, was not considered in the regressions. See tables and graphs of temperature data in Appendix D.

2.3.1.3 Occurrences of Tank 241-AP-103

No unusual events exclusively concerned Tank 241-AP-103.

2.3.1.4 Psychrometrics of Tank 241-AP-103

Psychrometric data have been recorded for six years from this tank and annulus. The apparent trend (according to the plot in Appendix F) of the evaporation rate from the tank has increased from an average of 60.7 gallons per week in February 1988 to an average of

79.9 gallons per week in January 1995. Over that same period, the trend in the rates of heat exchange through the primary tank ventilation has increased. The rates of heat exchange in the annular ventilation show a decreasing trend. The majority of the changes in the rates of heat exchange can be attributed to changes in the average ventilation rates. A review of the psychrometric data in Tank 241-AP-103 suggests a decrease in the rate of heat generation by the waste.

2.3.1.5 Historical Sample Analysis Data for Tank 241-AP-103

One sample analysis is available for Tank 241-AP-103, reported on February 26, 1988 (see Appendix H). The sample was clear with very little light brown solids. The sample was comprised of mostly sodium, ammonia, nitrite, nitrate, and hydroxide according to the chemical analysis. The most predominant radionuclides were strontium, americium, and rhodium.

Information on sampling procedures and methods were not available.

2.3.2 Current Status of Tank 241-AP-103

Tank 241-AP-103 was placed in service in October 1986 and currently stores approximately 26,000 gallons of waste (Hanlon, June 1995). The large decrease in volume was due to transferring waste to Tank 241-AW-102. The waste level in the tank is measured with a FIC gauge and a manual tape and has increased from about 350 inches in January 1991 to 410 inches in August 1991. In June 1993, the surface level dropped to about 10 inches. See Appendix E for details on waste surface level. This tank is active and the waste is currently being concentrated by the 242-A Evaporator. The tank is actively ventilated and categorized as sound. A plan view in Appendix G depicts the riser configuration as of August 3, 1995. Tank 241-AP-103 has 71 risers. Seven 4-inch risers (no. 15, no. 21, no. 24, three no. 27's, and no. 28), four 12-inch risers (no. 7, two no. 10's, and no. 12), two 24-inch risers (two no. 6's), and two 42-inch risers (two no. 5's) are available for use.

2.3.2.1 Inventory Estimate of Tank 241-AP-103

The three inventory estimates derived by the Los Alamos National Laboratory (LANL) predict the physical, chemical, and radiological constituents of the supernatant, the solids and the total volume for each tank. These estimates are presented in Appendix J.

2.3.2.2 Waste Volume Approximations for Tank 241-AP-103

The summary of approximated waste volumes, as derived from Los Alamos National Laboratory's supernatant mixing model (SMM) and tank layer model (TLM), are presented in Appendix K. The modeled volume is from the tank waste contents corresponding to the inventory estimate date of January 1, 1994. A tank cross-section that depicts the waste volume on the inventory estimate date is in Appendix G. The total waste volume on the inventory estimate date was

approximately 1,131,000 gallons according to the Tank Farm Surveillance and Waste Summary Report (Hanlon 1993). The total waste volume was divided by the SMM and the TLM into the following subsets. The SMM predicted 1,131,000 gallons of supernatant. The TLM did not predict any solids within the tank.

2.3.2.3 In-Tank Photograph of Tank 241-AP-103

No interior tank photographs are available.

2.3.3 Synopsis of Tank 241-AP-103

(To be completed.)

2.4 Tank 241-AP-104

2.4.1 241-AP-104 Tank History

2.4.1.1 Waste History of Tank 241-AP-104

The history of the primary additions is derived from the "Waste Status and Transaction Record Summary for the Southeast Quadrant" (Agnew 1995). Tank 241-AP-104 received N Reactor waste from the first quarter until the third quarter of 1987. The tank had two unknown transactions between the fourth quarter of 1989 and the first quarter of 1992.

The history of the waste types is derived from the Tank Farm Surveillance and Waste Status Summary Reports for January 1980 through March 1994. Tank 241-AP-104 began receiving Hanford facility waste in July 1986 and continued to receive this waste until May 1990. From June 1990 until March 1994, the tank waste was designated as dilute non-complexed waste.

The tank is currently an inactive grout feed tank. Sketch ES-TKS-E160, a graph representing the level history, and the historical waste level data used to generate the graph are in Appendix C.

2.4.1.2 Temperature History of Tank 241-AP-104

Temperatures from within Tank 241-AP-104 are recorded by 18 thermocouples. Non-suspect temperature data recorded between April 1986 and March 1995 for all 18 thermocouples were obtained from the computer automated surveillance system (CASS). Non-suspect temperature data taken between July 1989 and June 1995 for 12 of the thermocouples were obtained from the surveillance analysis computer system (SACS). However, not all of the 12 thermocouples have data covering that entire period. There were small breaks in the sequence of temperature data from each system. The average temperature during these periods was 61°F with a minimum of 46°F, a maximum of 78°F, and a standard deviation of 6.1°F. Linear regressions were performed on the data for each thermocouple with a resulting average decreasing slope of -0.0019°F/day. See tables and graphs of temperature data in Appendix D.

2.4.1.3 Occurrences of Tank 241-AP-104

One unusual event affected only Tank 241-AP-104. Occurrence report RL--WHC-Tank Farm-1991-0085 was issued in January 1991 because a loose wire to the alarm panel that monitors Tank 241-AP-104 caused a loss of power.

2.4.1.4 Psychrometrics of Tank 241-AP-104

Psychrometric data have been recorded for seven years from this tank and annulus. The apparent trend (according to the plot in Appendix F) of the evaporation rate from the tank has decreased from an average of 71.1 gallons per week in April 1987 to an average of

38.3 gallons per week in January 1995. Over that same period, the trend in the rates of heat exchange through the primary tank ventilation has decreased. The heat exchange rates in the annular ventilation show an increasing trend. The majority of the changes in the rate of heat exchange can be attributed to changes in the average ventilation rates. A review of the psychrometric data in Tank 241-AP-104 suggests an increase in the rate of heat generation by the waste.

2.4.1.5 Historical Sample Analysis Data for Tank 241-AP-104

A single sample is available for Tank 241-AP-104 (T-513) and was analyzed on August 5, 1987 (see Appendix H). The sample was a yellow brown liquid with almost no solids. The chemical analysis revealed a high concentration of sodium and phosphorous cations with phosphate and sulfate anions. Terbium and cobalt were the primary radionuclides found during the analysis.

Information on sampling procedures and methods were not available.

2.4.2 Current Status of Tank 241-AP-104

Tank 241-AP-104 was placed into service in October 1986 and currently stores approximately 22,000 gallons of waste (Hanlon, June 1995). The waste level in the tank is measured with a FIC gauge and a manual tape and has remained constant at about 10 inches since January 1991. See Appendix E for details on waste surface level. This tank is inactive at the present time. The tank is actively ventilated and categorized as sound. A plan view in Appendix G depicts the riser configuration as of August 3, 1995. Tank 241-AP-104 has 71 risers. Six 4-inch risers (no. 15, no. 21, three no. 27's, and no. 28), three 12-inch risers (no. 7, no. 10, and no. 12), two 24-inch risers (two no. 6's), and two 42-inch risers (two no. 5's) are available for use.

2.4.2.1 Inventory Estimate of Tank 241-AP-104

The three inventory estimates derived by the Los Alamos National Laboratory (LANL) predict the physical, chemical, and radiological constituents of the supernatant, the solids and the total volume for each tank. These estimates are presented in Appendix J.

2.4.2.2 Waste Volume Approximations for Tank 241-AP-104

The summary of approximated waste volumes, as derived from Los Alamos National Laboratory's supernatant mixing model (SMM) and tank layer model (TLM), are presented in Appendix K. The modeled volume is from the tank waste contents corresponding to the inventory estimate date of January 1, 1994. A tank cross-section that depicts the waste volume on the inventory estimate date is in Appendix G. The total waste volume on the inventory estimate date was approximately 18,000 gallons according to the Tank Farm Surveillance and Waste Summary Report (Hanlon 1993). The total waste volume was divided by the SMM and the TLM into the following subsets. The SMM

predicted 18,000 gallons of supernatant. The TLM did not predict any solids within the tank.

2.4.2.3 In-Tank Photograph of Tank 241-AP-104

No interior tank photographs are available.

2.4.3 Synopsis of Tank 241-AP-104

(To be completed.)

2.5 Tank 241-AP-105

2.5.1 241-AP-105 Tank History

2.5.1.1 Waste History of Tank 241-AP-105

Tank 241-AP-105 has no primary additions according to the "Waste Status and Transaction Record Summary for the Southeast Quadrant" (Agnew 1995).

The history of the waste types is derived from the Tank Farm Surveillance and Waste Status Summary Reports for January 1980 through March 1994. Tank 241-AP-105 began receiving non-complexed waste in July 1986 and continued to receive this waste until June 1989. From July 1989 until March 1994, the tank waste was designated as double-shell slurry feed waste.

The tank is currently an inactive concentrated waste holding tank. Sketch ES-TKS-E161, a graph representing the level history, and the historical waste level data used to generate the graph are in Appendix C.

2.5.1.2 Temperature History of Tank 241-AP-105

Temperatures from within Tank 241-AP-105 are recorded by 18 thermocouples. Non-suspect temperature data recorded between April 1986 and March 1995 for all 18 thermocouples were obtained from the computer automated surveillance system (CASS). Non-suspect temperature data taken between July 1989 and June 1995 for 12 of the thermocouples were obtained from the surveillance analysis computer system (SACS). However, not all of the 12 thermocouples have data covering that entire period. There were small breaks in the sequence of temperature data from each system. The average temperature during these periods was 74°F with a minimum of 53°F, a maximum of 121°F, and a standard deviation of 12.8°F. Linear regressions were performed on the data for each thermocouple with a resulting average increasing slope of 0.0101°F/day. See tables and graphs of temperature data in Appendix D.

2.5.1.3 Occurrences of Tank 241-AP-105

No unusual events exclusively concerned Tank 241-AP-105 since it went into service.

2.5.1.4 Psychrometrics of Tank 241-AP-105

Psychrometric data have been recorded for six years from this tank and annulus. The apparent trend (according to the plot in Appendix F) of the evaporation rate from the tank has increased from an average of 80 gallons per week in February 1988 to an average of 95.5 gallons per week in January 1995. Over that same period, the trend in the rates of heat exchange through the primary tank and annular ventilation has apparently increased. A review of the psychrometric data in Tank 241-AP-105 suggests an overall increase in the rate of heat generation by the waste.

2.5.1.5 Historical Sample Analysis Data for Tank 241-AP-105

No sampling data are available for this tank.

2.5.2 Current Status of Tank 241-AP-105

Tank 241-AP-105 entered service in October 1986 and currently stores 817,000 gallons of waste (Hanlon, June 1995). The waste level in the tank is measured with a FIC gauge and a manual tape and has remained constant at about 300 inches since January 1991. See Appendix E for details on waste surface level. This tank is inactive at the present time. The tank is actively ventilated and categorized as sound. A plan view in Appendix G depicts the riser configuration as of August 3, 1995. Tank 241-AP-105 has 71 risers. Seven 4-inch risers (no. 15, no. 21, no. 24, three no. 27's, and no. 28), four 12-inch risers (no. 7, two no. 10's, and no. 12), two 24-inch risers (two no. 6's), and two 42-inch risers (two no. 5's) are available for use.

2.5.2.1 Inventory Estimate of Tank 241-AP-105

The three inventory estimates derived by the Los Alamos National Laboratory (LANL) predict the physical, chemical, and radiological constituents of the supernatant, the solids and the total volume for each tank. These estimates are presented in Appendix J.

2.5.2.2 Waste Volume Approximations for Tank 241-AP-105

The summary of approximated waste volumes, as derived from Los Alamos National Laboratory's supernatant mixing model (SMM) and tank layer model (TLM), are presented in Appendix K. The modeled volume is from the tank waste contents corresponding to the inventory estimate date of January 1, 1994. A tank cross-section that depicts the waste volume on the inventory estimate date is in Appendix G. The total waste volume on the inventory estimate date was approximately 821,000 gallons according to the Tank Farm Surveillance and Waste Summary Report (Hanlon 1993). The total waste volume was divided by the SMM and the TLM into the following subsets. The SMM predicted 821,000 gallons of supernatant. The TLM did not predict any solids within the tank.

2.5.2.3 In-Tank Photograph of Tank 241-AP-105

No interior tank photographs are available.

2.5.3 Synopsis of Tank 241-AP-105

(To be completed.)

2.6 Tank 241-AP-106

2.6.1 241-AP-106 Tank History

2.6.1.1 Waste History of Tank 241-AP-106

Tank 241-AP-106 has no primary additions according to the "Waste Status and Transaction Record Summary for the Southeast Quadrant" (Agnew 1995).

The history of the waste types is derived from the Tank Farm Surveillance and Waste Status Summary Reports for January 1980 through March 1994. Tank 241-AP-106 began receiving Hanford facility waste in July 1986 and continued to receive this waste until September 1986. From October 1986 until May 1990, the tank received non-complexed waste. From June 1990 until March 1994, the tank waste was designated as dilute non-complexed waste.

The tank is currently an inactive dilute receiver tank. Sketch ES-TKS-E162, a graph representing the level history, and the historical waste level data used to generate the graph are in Appendix C.

2.6.1.2 Temperature History of Tank 241-AP-106

Temperatures from within Tank 241-AP-106 are recorded by 18 thermocouples. Non-suspect temperature data recorded between April 1986 and March 1995 for all 18 thermocouples were obtained from the computer automated surveillance system (CASS). Non-suspect temperature data taken between July 1989 and June 1995 for 12 of the thermocouples were obtained from the surveillance analysis computer system (SACS). However, not all of the 12 thermocouples have data covering that entire period. There were small breaks in the sequence of temperature data from each system. The average temperature during these periods was 70°F with a minimum of 52°F, a maximum of 119°F, and a standard deviation of 12.6°F. Linear regressions were performed on the data for each thermocouple with a resulting average increasing slope of 0.0076°F/day. See tables and graphs of temperature data in Appendix D.

2.6.1.3 Occurrences of Tank 241-AP-106

No unusual events exclusively concerned this tank since it went into service.

2.6.1.4 Psychrometrics of Tank 241-AP-106

Psychrometric data have been recorded for six years from this tank and annulus. The apparent trend (according to the plot in Appendix F) of the evaporation rate from the tank has decreased from an average of 94.7 gallons per week in May 1988 to an average of 57 gallons per week in January 1995. Over that same period, the trend in the rates of heat exchange through the primary tank ventilation has decreased. The rates of heat exchange through the annular ventilation show an increasing trend. The majority of the changes in

the rate of heat exchange can be attributed to changes in the average ventilation rates. A review of the psychrometric data in Tank 241-AP-106 suggests an increase in the rate of heat generation by the waste.

2.6.1.5 Historical Sample Analysis Data for Tank 241-AP-106

No sampling data are available for this tank.

2.6.2 Current Status of Tank 241-AP-106

Tank 241-AP-106 was placed in service in October 1986 and currently stores 108,000 gallons of waste (Hanlon, June 1995). The waste level in the tank is measured with a FIC gauge and a manual tape and has remained constant at about 410 inches from January 1991 to April 1995. From April 1995 to May 1995, the waste level dropped to about 40 inches. See Appendix E for details on waste surface level. The tank is actively ventilated and categorized as sound. A plan view in Appendix G depicts the riser configuration as of August 3, 1995. Tank 241-AP-106 has 71 risers. Seven 4-inch risers (no. 15, no. 21, no. 24, three no. 27's, and no. 28), four 12-inch risers (no. 7, two no. 10's, and no. 12), two 24-inch risers (two no. 6's), and two 42-inch risers (two no. 5's) are available for use.

2.6.2.1 Inventory Estimate of Tank 241-AP-106

The three inventory estimates derived by the Los Alamos National Laboratory (LANL) predict the physical, chemical, and radiological constituents of the supernatant, the solids and the total volume for each tank. These estimates are presented in Appendix J.

2.6.2.2 Waste Volume Approximations for Tank 241-AP-106

The summary of approximated waste volumes, as derived from Los Alamos National Laboratory's supernatant mixing model (SMM) and tank layer model (TLM), are presented in Appendix K. The modeled volume is from the tank waste contents corresponding to the inventory estimate date of January 1, 1994. A tank cross-section that depicts the waste volume on the inventory estimate date is in Appendix G. The total waste volume on the inventory estimate date was approximately 1,128,000 gallons according to the Tank Farm Surveillance and Waste Summary Report (Hanlon 1993). The total waste volume was divided by the SMM and the TLM into the following subsets. The SMM predicted 1,128,000 gallons of supernatant. The TLM did not predict any solids within the tank.

2.6.2.3 In-Tank Photograph of Tank 241-AP-106

No interior tank photographs are available.

2.6.3 Synopsis of Tank 241-AP-106

(To be completed.)

2.7 Tank 241-AP-107

2.7.1 241-AP-107 Tank History

2.7.1.1 Waste History of Tank 241-AP-107

The history of the primary additions is derived from the "Waste Status and Transaction Record Summary for the Southeast Quadrant" (Agnew 1995). Tank 241-AP-107 received PUREX ammonia scrubber feed waste and an unknown transaction during the first quarter of 1990.

The history of the waste types is derived from the Tank Farm Surveillance and Waste Status Summary Reports for January 1980 through March 1994. Tank 241-AP-107 began receiving double-shell slurry feed waste in July 1986 and continued to receive this waste until September 1986. From October 1986 until May 1990, the tank received non-complexed waste. The tank waste was designated as dilute non-complexed waste from June 1990 until March 1994.

The tank is currently an active dilute receiver tank with waste being concentrated by the 242-A Evaporator. Sketch ES-TKS-E163, a graph representing the level history, and the historical waste level data used to generate the graph are in Appendix C.

2.7.1.2 Temperature History of Tank 241-AP-107

Temperatures from within Tank 241-AP-107 are recorded by 18 thermocouples. Non-suspect temperature data recorded between April 1986 and March 1995 for 16 of 18 thermocouples were obtained from the computer automated surveillance system (CASS). However, not all of the 16 thermocouples have data covering that entire period. Non-suspect temperature data taken between July 1989 and June 1995 for 13 of the thermocouples were obtained from the surveillance analysis computer system (SACS). However, not all of the 13 thermocouples have data covering that entire period. There were small breaks in the sequence of temperature data from each system. The average temperature during these periods was 65°F with a minimum of 47°F, a maximum of 104°F, and a standard deviation of 12.3°F. Linear regressions were performed on the data from 15 of the 18 thermocouples with a resulting average increasing slope of 0.0072°F/day. The temperature data from 3 of the 18 thermocouples consistently disagreed with the trend of the rest and, subsequently, were not considered in the regressions. See tables and graphs of temperature data in Appendix D.

2.7.1.3 Occurrences of Tank 241-AP-107

No unusual events concerned the tank since it went into service.

2.7.1.4 Psychrometrics of Tank 241-AP-107

Psychrometric data have been recorded from this tank for five years and from the annulus for six years. The apparent trend (according to the plot in Appendix F) of the evaporation rate from

the tank has increased from an average of 122.3 gallons per week in December 1989 to an average of 184.6 gallons per week in January 1995. Over that same period, the trend in the rates of heat exchange through the primary tank and annular ventilation has apparently increased. A review of the psychrometric data in Tank 241-AP-107 suggests an overall increase in the rate of heat generation by the waste.

2.7.1.5 Historical Sample Analysis Data for Tank 241-AP-107

No sampling data are available for this tank.

2.7.2 Current Status of Tank 241-AP-107

Tank 241-AP-107 was placed in service in October 1986 and currently stores 28,000 gallons of waste (Hanlon, June 1995). The waste level in the tank is measured with a FIC gauge and a manual tape, and has decreased from 405 inches to 59 inches in October 1994. In March 1995, the waste level increased to about 380 inches and then decreased to about 10 inches in June 1995. The decrease was due to transferring waste to Tank 241-AW-102 on October 1994. See Appendix E for details on waste surface level. This tank is active and the waste is currently being concentrated by the 242-A Evaporator. The tank is actively ventilated and categorized as sound. A plan view in Appendix G depicts the riser configuration as of August 3, 1995. Tank 241-AP-107 has 71 risers. Seven 4-inch risers (no. 15, no. 21, no. 24, three no. 27's, and no. 28), three 12-inch risers (two no. 10's and no. 12), two 24-inch risers (two no. 6's), and three 42-inch risers (three no. 5's) are available for use.

2.7.2.1 Inventory Estimate of Tank 241-AP-107

The three inventory estimates derived by the Los Alamos National Laboratory (LANL) predict the physical, chemical, and radiological constituents of the supernatant, the solids and the total volume for each tank. These estimates are presented in Appendix J.

2.7.2.2 Waste Volume Approximations for Tank 241-AP-107

The summary of approximated waste volumes, as derived from Los Alamos National Laboratory's supernatant mixing model (SMM) and tank layer model (TLM), are presented in Appendix K. The modeled volume is from the tank waste contents corresponding to the inventory estimate date of January 1, 1994. A tank cross-section that depicts the waste volume on the inventory estimate date is in Appendix G. The total waste volume on the inventory estimate date was approximately 1,108,000 gallons according to the Tank Farm Surveillance and Waste Summary Report (Hanlon 1993). The total waste volume was divided by the SMM and the TLM into the following subsets. The SMM predicted 1,108,000 gallons of supernatant. The TLM did not predict any solids within the tank.

2.7.2.3 In-Tank Photograph of Tank 241-AP-107

No interior tank photographs are available.

2.7.3 Synopsis of Tank 241-AP-107

(To be completed.)

2.8 Tank 241-AP-108

2.8.1 241-AP-108 Tank History

2.8.1.1 Waste History of Tank 241-AP-108

The history of the primary additions is derived from the "Waste Status and Transaction Record Summary for the Southeast Quadrant" (Agnew 1995). Tank 241-AP-108 received PUREX ammonia scrubber feed waste during the first quarter of 1990. From the first quarter of 1991 until the second quarter of 1992, the tank received PUREX low-level waste. The tank had two unknown transactions between the fourth quarter of 1991 and the fourth quarter of 1992. The tank received dilute non-complexed waste from the 200-East Area single-shell tanks during the first quarter of 1994.

The history of the waste types is derived from the Tank Farm Surveillance and Waste Status Summary Reports for January 1980 through March 1994. Tank 241-AP-108 began receiving double-shell slurry feed waste in July 1986 and continued to receive this waste until September 1986. From October 1986 until May 1990, the tank received non-complexed waste. From June 1990 until March 1994, the tank was designated as containing dilute non-complexed waste.

The tank is currently an active dilute receiver tank with waste being concentrated by the 242-A Evaporator. Sketch ES-TKS-E164, a graph representing the level history, and the historical waste level data used to generate the graph are in Appendix C.

2.8.1.2 Temperature History of Tank 241-AP-108

Temperatures from within Tank 241-AP-108 are recorded by 18 thermocouples. Non-suspect temperature data recorded between April 1986 and March 1995 for all 18 thermocouples were obtained from the computer automated surveillance system (CASS). Non-suspect temperature data taken between July 1989 and June 1995 for 12 of the thermocouples were obtained from the surveillance analysis computer system (SACS). However, not all of the 12 thermocouples have data covering that entire period. There were small breaks in the sequence of temperature data from each system. The average temperature during these periods was 69°F with a minimum of 50°F, a maximum of 117°F, and a standard deviation of 14.3°F. Linear regressions were performed on the data for each thermocouple with a resulting average increasing slope of 0.0102°F/day. See tables and graphs of temperature data in Appendix D.

2.8.1.3 Occurrences of Tank 241-AP-108

No unusual events concerned the tank since it went into service.

2.8.1.4 Psychrometrics of Tank 241-AP-108

Psychrometric data have been recorded from this tank for five years and from the annulus for six years. The apparent trend (according to the plot in Appendix F) of the evaporation rate from

the tank has increased from an average of 42.3 gallons per week in December 1989 to an average of 125.9 gallons per week in January 1995. Over that same period, the trend in the rates of heat exchange through the primary tank and annular ventilation has apparently increased. A review of the psychrometric data in Tank 241-AP-108 suggests an overall increase in the rate of heat generation by the waste.

2.8.1.5 Historical Sample Analysis Data for Tank 241-AP-108

No sampling data are available for this tank.

2.8.2 Current Status of Tank 241-AP-108

Tank 241-AP-108 entered service in October 1986 and currently stores 29,000 gallons of waste (Hanlon, June 1995). The waste level in the tank is measured with a FIC gauge and a manual tape and has increased from about 50 inches in January 1991 to 340 inches in November 1991. In February 1994, the surface level increased to about 410 inches. The waste level then decreased to 288 inches in January 1995. In 1995, the tank has decreased to about 10 inches, increased to about 360 inches, and then decreased to about 10 inches. The increase was attributed to waste received from Tank 241-AY-102 in November 1991. The decrease was because waste was transferred to Tanks 241-AP-101 and 241-AW-102 in October 1994. See Appendix E for details on waste surface level. This tank is active and the waste is currently being concentrated by the 242-A Evaporator. The tank is actively ventilated and categorized as sound. A plan view in Appendix G depicts the riser configuration as of August 3, 1995. Tank 241-AP-108 has 71 risers. Seven 4-inch risers (no. 15, no. 21, no. 24, three no. 27's, and no. 28), four 12-inch risers (no. 7, two no. 10's, and no. 12), two 24-inch risers (two no. 6's), and two 42-inch risers (two no. 5's) are available for use.

2.8.2.1 Inventory Estimate of Tank 241-AP-108

The three inventory estimates derived by the Los Alamos National Laboratory (LANL) predict the physical, chemical, and radiological constituents of the supernatant, the solids and the total volume for each tank. These estimates are presented in Appendix J.

2.8.2.2 Waste Volume Approximations for Tank 241-AP-108

The summary of approximated waste volumes, as derived from Los Alamos National Laboratory's supernatant mixing model (SMM) and tank layer model (TLM), are presented in Appendix K. The modeled volume is from the tank waste contents corresponding to the inventory estimate date of January 1, 1994. A tank cross-section that depicts the waste volume on the inventory estimate date is in Appendix G. The total waste volume on the inventory estimate date was approximately 899,000 gallons according to the Tank Farm Surveillance and Waste Summary Report (Hanlon 1993). The total waste volume was divided by the SMM and the TLM into the following subsets. The SMM predicted 899,000 gallons of supernatant. The TLM did not predict any solids within the tank.

2.8.2.3 In-Tank Photograph of Tank 241-AP-108

No interior tank photographs are available.

2.8.3 Synopsis of Tank 241-AP-108

GLOSSARY

0.17	Transaction flag key-monthly volumes derived from semiannual reports.
0.33	Transaction flag key-monthly volumes derived from quarterly reports.
1	Monthly report
1AYIN	See Waste Abbreviations (pg. A29-A40).
1AZIN	See Waste Abbreviations (pg. A29-A40).
1C	See Waste Abbreviations and first- and second-cycle decontamination waste.
1CEB	See Waste Abbreviations (pg. A29-A40).
1CS	See Waste Abbreviations (pg. A29-A40).
1st Generation Tank	The original tank design found in Tank Farms B, C, T, U (excluding the 200 series tanks), and BX. These tanks have an operating capacity of 530,000 gallons, a 75-foot diameter, a 12-inch dish bottom, and a 4-foot knuckle. See Type II tanks.
222-B	See Facilities (pg. A41).
222-C	See Facilities (pg. A41).
222-T	See Facilities (pg. A41).
222-U	See Facilities (pg. A41).
224	See Waste Abbreviations (pg. A29-A40).
224-F	See Waste Abbreviations (pg. A29-A40).
231Z	See Waste Abbreviations (pg. A29-A40).
242-A	See Facilities (pg. A41).
242-B	See Facilities (pg. A41).
242-S	See Facilities (pg. A41).

242-T	See Facilities (pg. A41).
2AYIN	See Waste Abbreviations (pg. A29-A40).
2AZIN	See Waste Abbreviations (pg. A29-A40).
2C	See Waste Abbreviations (pg. A29-A40) and first- and second-cycle decontamination waste.
2nd Generation Tank	Same as original tank design (1st generation or Type II) except the operating capacity was increased to 758,000 gallons. See Type III tanks.
2SYIN	See Waste Abbreviations (pg. A29-A40).
3	Quarterly report
3AWIN	See Waste Abbreviations (pg. A29-A40).
3rd Generation Tank	The first generation of the Type IV tanks, contained only in the SX Tank Farm. These tanks have a 1,000,000 gallon operating capacity, a 75-foot diameter, a 14.875-inch dish bottom, and no knuckle. See Type IV tanks.
4th Generation Tank	The second generation of the Type IV tanks, found only in the A Tank Farm. These tanks are the same as the 3rd generation except they have a flat bottom. See Type IV tanks.
5	See Waste Abbreviations (pg. A29-A40).
5-6#	Cell 5 tank 6 in B Plant
5AWIN	See Waste Abbreviations (pg. A29-A40).
5th Generation Tank	The third generation of the Type IV tanks, found only in the AX Tank Farm. These tanks are the same as the 4th generation with the addition of a grid of drain slots in the concrete beneath the bottom of primary steel liner.
6	Semiannual report
6AWIN	See Waste Abbreviations (pg. A29-A40).
A Plant (PUREX)	See Facilities (pg. A41).

A1 SLTCK	See Waste Abbreviations (pg. A29-A40).
A2 SLTSLRY	See Waste Abbreviations (pg. A29-A40).
Active Tank	A tank that contains more than 33,000 gallons of waste and/or is still involved in waste management operations.
Active Drywell	Drywell in which radiation readings of greater than 50 counts/second are detected. The readings must be consistent as to depth and radiation level for repeated readings to be considered active.
ADD	Add primary waste from process.
ADJ	Adjustment to waste amount; see CORR.
AGE, AGING	Abbreviations for aging waste
Aging Waste	High-level, first-cycle solvent extraction waste from the PUREX Plant sent to tanks to allow decay (aging) of the radionuclides, thus reducing the high temperature of the waste; see NCAW.
Airlift Circulator	A device installed in tanks used to age wastes. The circulators promote mixing of the supernatant and prevent agglomeration of radionuclides. By maintaining motion within the body of liquid, the circulators minimize overheating and, consequently, minimize bumping.
Annulus	A vessel space in the form of a ring; the space between concentric circular walls. The annulus of the double-shell tanks includes all of the space between the two steel liners.
AR Vault	A structure containing tanks and chemical processing equipment, used for waste processing or storage operations.
AR	See Waste Abbreviations (pg. A29-A40).
Assumed Leaker	A waste storage tank for which past surveillance data has indicated a loss of liquid attributed to a breach of integrity.

Assumed Re-leaker	A designation that is applied when surveillance data indicate a new loss of liquid from a tank that has been declared an "assumed leaker."
Assumed Leaking Tank	In 1984, the designations of "suspect leaker," "questionable integrity," "confirmed leaker," "declared leaker," "borderline," and "dormant" were merged into one category called "assumed leaker."
B	See Waste Abbreviations (pg. A29-A40).
B860N	See Waste Abbreviations (pg. A29-A40).
B SLTCK	See Waste Abbreviations (pg. A29-A40).
B Plant (222-B)	See Facilities (pg. A41).
Background Radiation	Radioactivity from naturally occurring sources; primarily radiation from cosmogenic and naturally occurring radionuclides.
Baseline	A reference; for example, a specified liquid level or radiation level against which new information is compared.
BFSH	See Waste Abbreviations (pg. A29-A40).
BL	See Waste Abbreviations (pg. A29-A40).
BLEB	See Waste Abbreviations (pg. A29-A40).
BLIX	See Waste Abbreviations (pg. A29-A40).
BLIXB	See Waste Abbreviations (pg. A29-A40).
BNW	Battelle Northwest Laboratory; also, see Waste Abbreviations.
BPDCC	See Waste Abbreviations (pg. A29-A40).
BPDCS	See Waste Abbreviations (pg. A29-A40).
BPDCV	See Waste Abbreviations (pg. A29-A40).
BPFPS	See Waste Abbreviations (pg. A29-A40).
BPLCS	See Waste Abbreviations (pg. A29-A40).

BPLDC	See Waste Abbreviations (pg. A29-A40).
BPLDN	See Waste Abbreviations (pg. A29-A40).
Bumping, Tank Bump	A tank bump occurs when solids overheat in the lower portion of the tank. The hot solids rapidly transfer heat to the liquid, some of which quickly vaporizes. The sudden pressurization caused by vapor generation is called a "bump."
BVCLN	See Waste Abbreviations (pg. A29-A40).
BY SLTCK	See Waste Abbreviations (pg. A29-A40).
C Plant (222-C)	See Facilities (pg. 38); see Strontium Semiworks; see SSW in Waste Abbreviations (pg. 36).
Caisson	An underground structure used to store high-level waste; typical designs include corrugated metal or concrete cylinders, 55-gallon drums welded end-to-end, and vertical steel pipes.
Calcine	To heat a substance to a high temperature, but below its melting point, causing loss of volatile constituents such as moisture; refers also to the material produced by this process.
CARB	See Waste Abbreviations (pg. A29-A40) and organic wash waste.
CAS	Cascade; see SET and END.
Cascade	Eleven of the single-shell tank farms (all except the AX Tank Farm) were equipped with overflow lines between tanks. The tanks were connected in series and were placed at different elevations creating a downhill gradient for liquids to flow from one tank to another. Thus, multiple tanks could be filled with one pump.
CASS	Computer automated surveillance system
Catch Tanks	Small capacity single-shell tanks associated with diversion boxes and diverter stations. The tanks are

designed to receive any transfer line clean out, spills or leakage from the boxes, or leakage from the adjacent pipe encasement.

CAW	Current acid waste; this is PUREX acid high-level waste.
CC	See Waste Abbreviations (pg. A29-A40).
CCGL	See Waste Abbreviations (pg. A29-A40).
CCGR	See Waste Abbreviations (pg. A29-A40).
CCPL, CCPLX	See Waste Abbreviations (pg. A29-A40).
CCW	Concentrated customer waste
CDF	Composition data file or transaction flag key-unit volume assumed to make stream active.
CE	See Waste Abbreviations (pg. A29-A40).
CELL 23	Waste from Cell 23 at B Plant; Cell 23 contained an evaporator.
CEM	See Waste Abbreviations (pg. A29-A40).
CF	See Waste Abbreviations (pg. A29-A40).
CON	See Waste Abbreviations (pg. A29-A40).
COND	Condensate; see EVAP, EB.
Condensate	Liquid formed from cooling vapors
Conductivity Probe	A device that completes an electrical circuit when contacted by a conductive material.
Confirmed or Declared Leaker	The designation of any underground waste storage tank where the data are considered sufficient to support a conclusion with 95 percent confidence that the tank has leaked.
COOL	Change in waste volume due to cooling; see CORR.
CORR	Correction to waste amount; see ADJ, LEAK, COOL.

CP	See Waste Abbreviations (pg. A29-A40).
CPLX	See Waste Abbreviations (pg. A29-A40).
CR Vault	Facility located adjacent to C Tank Farm, used for scavenging campaign following uranium recovery. Ferrocyanide was added to tank supernatant in the CR Vault and the slurry was returned to C Tank Farm.
Crib	A linear excavation approximately 15 feet in depth with a perforated pipe along the bottom. The ditch was backfilled with broken rock, gravel, or other loose material and then covered by soil and a membrane with very low permeability. The pipe distributed intermediate level liquid wastes along the crib.
Crust	A hard surface layer that has formed on top of the liquid in many waste tanks that contain concentrated solutions.
CSFD	See Waste Abbreviations (pg. A29-A40).
CSR	See Waste Abbreviations (pg. A29-A40).
CSS	See Waste Abbreviations (pg. A29-A40).
CST	See Waste Abbreviations (pg. A29-A40).
CSWLE	See Waste Abbreviations (pg. A29-A40).
CSWLW	See Waste Abbreviations (pg. A29-A40).
CTW	Caustic waste for makeup
CW	See Waste Abbreviations (pg. A29-A40).
CW/ZR1	See Waste Abbreviations (pg. A29-A40).
CW/ZR2	See Waste Abbreviations (pg. A29-A40).
CWP	See Waste Abbreviations (pg. A29-A40).
CWP2	See Waste Abbreviations (pg. A29-A40).
CWR	See Waste Abbreviations (pg. A29-A40).
CWR1	See Waste Abbreviations (pg. A29-A40).

CWR/A1	See Waste Abbreviations (pg. A29-A40).
CX70	See Waste Abbreviations (pg. A29-A40).
D	Transaction Flag Key-amount by difference
DBP	Dibutyl phosphate
DC	See Waste Abbreviations (pg. A29-A40).
DCS	Dilute caustic solutions
DE	Diatomaceous earth; this was added to Tanks 241-BX-102, -SX-113, -TX-106, -TY-106, and -U-104 from 1970 to 1972. Also, see Waste Abbreviations (pg. A29-A40).
Deliquescent	Capable of absorbing moisture from the air and dissolving to become a liquid.
Desiccant	A drying agent such as diatomaceous earth.
Diatomaceous Earth	Diatomite; a light friable siliceous material derived from diatom (algae) remains. It was added to selected underground waste storage tanks to absorb and, thereby, immobilize residual liquids (i.e. help stabilize the tank).
DIL	Dilution
DILFD	Dilute feed
Ditch	A linearly oriented excavation often used for the temporary diversion or disposal of process waste streams.
Diversion Box	A below grade, concrete enclosure containing the remotely maintained jumpers and spare nozzles for the routing of waste solution to storage tank farms.
DN	See Waste Abbreviations (pg. A29-A40).
DN/PT	See Waste Abbreviations (pg. A29-A40).
DN/PD	See Waste Abbreviations (pg. A29-A40).

Double-Shell Tank	The newer underground waste storage tanks consisting of a concrete shell and two concentric carbon steel liners with an annulus between the liners.
Double-Shell Slurry	Waste that exceeds the sodium aluminate saturation boundary in the evaporator without exceeding receiver tank composition limits. It is considered a solid for reporting purposes.
Double-Shell Slurry Feed	Waste concentrated just before reaching the sodium aluminate saturation boundary in the evaporator without exceeding receiver tank composition limits. This form is not as concentrated as double-shell slurry.
Drywell	A steel casing, generally 6 inches in diameter, drilled into the ground to various depths and used to insert monitoring instruments for measuring the presence of radioactivity or moisture content.
Drywell (in-tank)	A sealed casing within a tank that is attached to a riser. It is used to insert experimental equipment, such as neutron or acoustical probes, to determine the level of drainable interstitial liquor.
DSS	See Waste Abbreviations and double-shell slurry.
DSSF	See Waste Abbreviations and double-shell slurry feed.
DST	Double-shell tank
DUMM, DUMMY	See Waste Abbreviations (pg. A29-A40).
DW	See Waste Abbreviations (pg. A29-A40).
DWBIX	See Waste Abbreviations (pg. A29-A40).
E	Transaction flag key-waste transferred through evaporator.
EB	See Waste Abbreviations (pg. A29-A40).
EDTA	Ethylenediaminetetra-acetic acid

EF	See Waste Abbreviations (pg. A29-A40).
EFD	See Waste Abbreviations (pg. A29-A40).
END	Disconnect cascaded tanks; see CAS, SET.
ENRAF	Electronic surface level gauge that uses a weighted plummet connected to a scale for measuring waste surface level. At Hanford, they are electrically connected to a computer for data transmission, analysis, and reporting.
EV	Evaporation
EVAP	See Waste Abbreviations (pg. A29-A40).
EVAPF	See Waste Abbreviations (pg. A29-A40).
Evaporator Feed	Any waste liquid that can be concentrated to form saltcake; e.g., aged waste, low heat waste, dilute interstitial liquor, and other radioactive waste solutions.
Evaporator-Crystallizer	242-A and 242-S waste concentration facilities that operate at a reduced pressure (vacuum) and are capable of producing a slurry containing about 30 volume percent solids at a specific gravity greater than 1.6.
EVS	Partial neutralization in the 242-S Evaporator.
EVT	HEDTA destruction in the 242-B or 242-T Evaporators.
FD	See Waste Abbreviations (pg. A29-A40).
FECN	Ferrocyanide wastes created during a scavenging campaign from 1953-57. See SCAV, POO-P##, TOO-T##.
Ferrocyanide	An ion composed of iron and cyanide with the chemical formula of $\text{Fe}(\text{CN})_6^{-4}$.
FIC gauge	A Food Instrument Corporation (a.k.a. Food Industry Corporation) automatic liquid level gauge based on a conductivity probe. At Hanford, they are electrically connected to a computer

for data transmission, analysis, and reporting. Local readings may also be obtained from a dial.

First- and Second-Cycle Decontamination Wastes	Waste containing 10% of the original fission product activity and 2% of the products. By-product cake solution was mixed with product waste and neutralized with 50% caustic. The waste contained a mixture of suspended solids, iron, hydroxides, carbonate, phosphate, scavenger metals, chromium, sodium, and silicofluoride.
FLSH	See Waste Abbreviations (pg. A29-A40).
FP	Fission product waste (see Waste Abbreviations, pg. 28-38)—produced at B Plant and Hot Semiworks in campaigns for cesium and strontium recovery during the 1960's. Cesium was removed from PUREX supernatant and strontium was removed from PUREX sludge; both were removed from acidic waste.
GA	Gain to tank; any increase in volume
Gamma Ray	Electromagnetic radiation emitted by the nuclei of some radioactive substances during decay, similar to X-rays.
GAS	Slurry growth resulting from gas generation.
GM Instrument	Instrument for detecting low-level beta and gamma radiation using a Geiger-Mueller tube.
GROUP	A group of tanks where ITS was used to evaporate the supernatant phases. See ITS.
Gunite	A building material, consisting of a mixture of cement, sand, and water, that is sprayed onto a mold.
H ₂ O	Water
HDRL	See Waste Abbreviations (pg. A29-A40).
HEAT	A tank correction; see CORR, COOL.

HEDTA	N-hydroxyethylenediaminetri-acetic acid
Heel	The amount remaining in a vessel or container after most of the contents have been removed.
Hexone	Methyl isobutyl ketone, an organic solvent used in the REDOX solvent extraction process. Also known as isobutyl methyl ketone, methyl isobutyl ketone, 4-methyl 2-pentanone, MIBK.
High-Heat Load	Heat load in tanks produced by radionuclides exceeds 40,000 Btu/hr.
High-Level Waste	Waste from the fuel reprocessing operations in separations plants.
Historical Information	All information obtained from published and unpublished sources. Unpublished sources include photographs and electronically retrieved data (i.e. liquid observation well data, sampling results, temperatures, and surface level data).
HLO	Hanford Laboratory Operations; also, see Waste Abbreviations (pg. A29-A40).
HLW	See Waste Abbreviations (pg. A29-A40).
HOT-SEMI	See HS, SSW.
HS	Hot Semiworks (C Plant); a pilot facility with a variety of operations. See Waste Abbreviations (pg. A29-A40).
HWVP	Dilute non-complexed waste from the vitrification plant.
I&S	Tank isolated and stabilized
Inactive Tank	A tank that has been removed from liquid-processing service, has been pumped to less than 33,000 gallons of waste, and will be, or is in the process of being, stabilized and interimly isolated. This includes all tanks not in active or active-restricted categories. Also included are inactive spare tanks that would be used if an active tank failed.

INST	Change in tank level due to change in instrumentation.
Interim Isolation	An administrative designation reflecting the completion of the physical effort required to minimize the addition of liquids into an inactive storage tank, process vault, sump, catch tank, or diversion box. (In June 1993, "interim isolation" was replaced by "intrusion prevention".)
Interim Stabilization	A tank which contains less than 50,000 gallons of drainable interstitial liquid and less than 5,000 gallons of supernatant. If a jet pump was used to achieve interim stabilization, then the jet pump flowrate must have been at or below 0.05 gallons per minute before interim stabilization was completed.
Interstitial Liquor	The liquid that fills the interstices (voids) within the solid material in a waste tank.
Interstitial	The volume within a solid matrix made up of the crevices, cracks, and other voids.
Intrusion Mode FIC Setting	The FIC probe is positioned a short distance above the waste surface. If the surface level of the waste in the tank increases, thereby touching the probe tip, a positive indication is received.
Intrusion Prevention	An administrative designation reflecting the completion of the physical effort required to minimize the addition of liquids into an inactive storage tank, process vault, catch tank, sump, or diversion box.
ISO	Tank is interrimly isolated.
ITS	The In-Tank Solidification Program was used to reduce waste volume by evaporating the wastes from inside certain tanks in the BX and BY Farms. The process used both hot air (ITS-1) and an electric heater (ITS-2).

IWW	See Waste Abbreviations (pg. A29-A40).
IX	See Waste Abbreviations (pg. A29-A40).
Jet Pump	A modified, commercially available, low capacity jet pump used as a saltwell pump.
Knuckle	Point where the side wall and the bottom curved surface of a tank meet.
L222S	See Waste Abbreviations (pg. A29-A40).
L3A4A	See Waste Abbreviations (pg. A29-A40).
LaF	See Waste Abbreviations (pg. A29-A40).
Lateral	Horizontal drywell under all tanks in A Tank Farm and certain tanks in SX Tank Farm.
Leak Detection Pit	Collection point for any leakage from tanks in AX Tank Farm. The pits are equipped with radiation and liquid detection instruments.
LEAK	Tank leak volume; see CORR.
LETF	Liquid effluent treatment facility at N Reactor.
LIT	Level indicating transmitter
Level Adjustment	Any update in the waste inventory (or tank level) in a tank. The adjustments usually result from surveillance observations or historical investigations.
Level History	A diagram representing the history of the waste surface level in a tank. The diagram also includes other related data.
Liquid Observation Well (LOW)	Liquid observation wells are used to monitor the interstitial liquid level (ILL) in single-shell waste storage tanks. Three probes are used to monitor changes in the ILL: acoustic, gamma, and neutron. Each method can indicate intrusions or leaks by increases or decreases in the ILL.

Liquid Level Best Engineering Judgement Line	A line representing the level of interstitial liquids on the history level plot, according to engineering judgement, between the time the liquid was initially pumped until LOW readings were obtained.
LO	Loss from tank; unexplained loss of volume, does not include transfers
LUNC	See Waste Abbreviations (pg. A29-A40).
LW	See Waste Abbreviations (pg. A29-A40).
Metal Waste (MW)	Waste from extraction containing all the uranium, approximately 90% of the original fission product activity, and approximately 1% of the product. This waste was brought to the neutral point with 50% caustic and then treated with an excess of sodium carbonate. This procedure yielded almost completely soluble waste at a minimum total volume. The exact composition of the carbonate compounds was not known, but was assumed to be a uranium phosphate carbonate mixture.
MH	Manhole
Mixed Waste	Waste containing both radioactive and hazardous (dangerous as defined in WAC 173-303) waste.
Molarity	Number of gram molecular weights (moles) per liter of solution.
Mole	The amount of a substance with weight equal to the molecular weight in grams.
MW	See Waste Abbreviations (pg. A29-A40) and metal waste.
MWF	See Waste Abbreviations (pg. A29-A40).
N	See Waste Abbreviations (pg. A29-A40).
NCAW	See Waste Abbreviations (pg. A29-A40).
NCPL, NCPLX, NCPLX	See Waste Abbreviations (pg. A29-A40) and non-complexed.

NCRW	See Waste Abbreviations (pg. A29-A40).
Neutralized PUREX Acid Waste	In 1956, the original plant neutralized all of the high-level waste and sent it to the A Tank Farm. As recovery of fission products began, a portion of the waste was treated to recover strontium and then neutralized. As of 1967, all of the high-level waste left PUREX as an acid solution for treatment at B Plant. See P, NCAW, and IWW.
Neutron Probe	Probe equipped with a neutron source and detector. They are used in dry well monitoring to determine the moisture content of the soil as one way to detect leaks in underground waste storage tanks or pipelines.
NFAW	See Waste Abbreviations (pg. A29-A40).
NHAW	See Waste Abbreviations (pg. A29-A40).
NIT	HNO ₃ /KMNO ₄ solution added during evaporator operation.
Noise At The Bottom Of Well-Drywell Probe	Erroneous reading caused by probe contacting foreign objects at the bottom of a well.
Non-Complexed	General waste term applied to all Hanford Site liquors not identified as complexed (containing organics).
NPH	Normal paraffin hydrocarbon
NRAW	See Waste Abbreviations (pg. A29-A40).
NRP82	See Waste Abbreviations (pg. A29-A40).
NRPO4	See Waste Abbreviations (pg. A29-A40).
NRSO4	See Waste Abbreviations (pg. A29-A40).
NTA	Nitrilotriacetic acid
Nuclear reactor	A device for creating a controlled nuclear chain reaction using atomic fuel, as for the production of energy.

Open Hole Saltwell	A well in which a pump is inserted in solid waste. It is frequently used to remove the liquid from tanks containing less than two feet of sludge.
Organic Wash Waste (OWW)	The solvent used in PUREX was treated before reuse by washing with potassium permanganate and sodium carbonate, followed by dilute nitric acid and then a sodium carbonate wash.
Out-of-Service-Tank	A tank that does not meet the definition of an in-service tank. Before September 1988, these tanks were defined as inactive. (Note: All single-shell tanks are out of service.)
OWW	See Waste Abbreviations (pg. A29-A40) and organic wash waste.
P	See Waste Abbreviations (pg. A29-A40).
P1	See Waste Abbreviations (pg. A29-A40).
P2	See Waste Abbreviations (pg. A29-A40).
P3	See Waste Abbreviations (pg. A29-A40).
PADFG	See Waste Abbreviations (pg. A29-A40).
PADWG	See Waste Abbreviations (pg. A29-A40).
Partial Interim Isolation	The administrative designation for completion of the physical effort required for Interim Isolation, except for isolating the risers and piping that will be required for jet pumping or for other methods of stabilization.
PAS	See Waste Abbreviations (pg. A29-A40).
PASF	See Waste Abbreviations (pg. A29-A40).
PAW	See Waste Abbreviations (pg. A29-A40).
PD	See Waste Abbreviations (pg. A29-A40).
PDBNG	See Waste Abbreviations (pg. A29-A40).
PDBSU	See Waste Abbreviations (pg. A29-A40).
PDBTG	See Waste Abbreviations (pg. A29-A40).

PDCSS	See Waste Abbreviations (pg. A29-A40).
PDL87	See Waste Abbreviations (pg. A29-A40).
PDL89	See Waste Abbreviations (pg. A29-A40).
PDNSG	See Waste Abbreviations (pg. A29-A40).
PDS87	See Waste Abbreviations (pg. A29-A40).
PDS89	See Waste Abbreviations (pg. A29-A40).
PDSLGL	See Waste Abbreviations (pg. A29-A40).
PDSUP	See Waste Abbreviations (pg. A29-A40).
PFeCN	See Waste Abbreviations (pg. A29-A40).
PFeCN1	See Waste Abbreviations (pg. A29-A40).
PFeCN2	See Waste Abbreviations (pg. A29-A40).
PFM	See Waste Abbreviations (pg. A29-A40).
PFMMS	See Waste Abbreviations (pg. A29-A40).
PFPP (Z Plant)	See facilities (pg. A41). Also, Plutonium Finishing Plant waste (see PRF, and Z, 224, and PFPP in Waste Abbreviations, pg. 28-38).
PFPPGR	See Waste Abbreviations (pg. A29-A40).
PFPPNT	See Waste Abbreviations (pg. A29-A40).
PFPPPT	See Waste Abbreviations (pg. A29-A40).
PFPPSL	See Waste Abbreviations (pg. A29-A40).
pH	A measure of the hydrogen ion concentration in solution.
Pile	An early term used to describe a nuclear reactor.
PL	See Waste Abbreviations (pg. A29-A40).
PL1	See Waste Abbreviations (pg. A29-A40).
PL2	See Waste Abbreviations (pg. A29-A40).
PML89	See Waste Abbreviations (pg. A29-A40).

PMS89	See Waste Abbreviations (pg. A29-A40).
PN	See Waste Abbreviations (pg. A29-A40).
PNF	See Waste Abbreviations (pg. A29-A40).
POO-P##	In-Plant scavenging with FeCN; see SCAV, TOO-T##.
Portland Cement	A hydraulic cement made by finely pulverizing a mixture of clay and limestone or similar materials.
PRF	Plutonium Reclamation Facility; a facility by PFP (Z Plant) that generated a type of waste (also known as PRF) from a solvent based extraction process using CCl ₄ /TBP.
Primary Addition	An addition of waste from a specific plant or process vault. These additions are listed in the "Waste Status and Transaction Record Summary for the Southeast Quadrant."
Primary Stabilization	The condition of an inactive waste storage tank after all liquid above the solids, other than isolated surface pockets, has been removed. Isolated surface pockets of liquid are those not pumpable by conventional techniques.
Probe	A device used to obtain information about the environment. In this report, an instrument package designed to be inserted in drywells, risers, or ports to measure waste characteristics.
PSL	See Waste Abbreviations (pg. A29-A40).
PSS	See Waste Abbreviations (pg. A29-A40).
PSSF	See Waste Abbreviations (pg. A29-A40).
Psychrometry	Determination of humidity or dew point from wet and dry bulb temperatures with the difference in the two used as a measure of moisture in the atmosphere.
PT	See Waste Abbreviations (pg. A29-A40).
PUREX	See Facilities (pg. A41).

PX86S	See Waste Abbreviations (pg. A29-A40).
PXBAW	See Waste Abbreviations (pg. A29-A40).
PXBSG	See Waste Abbreviations (pg. A29-A40).
PXFTE	See Waste Abbreviations (pg. A29-A40).
PXLOW	See Waste Abbreviations (pg. A29-A40).
PXMET	See Waste Abbreviations (pg. A29-A40).
PXMSC	See Waste Abbreviations (pg. A29-A40).
PXNAW	See Waste Abbreviations (pg. A29-A40).
Questionable Integrity	A designation for any tank with a small decrease in liquid level or a radiation increase in an associated dry well for which the remaining data for the tank are insufficient to support a conclusion with 95% confidence that the tank is sound.
R	See Waste Abbreviations (pg. A29-A40).
R SLTCK	See Waste Abbreviations (pg. A29-A40).
R1	See Waste Abbreviations (pg. A29-A40).
R2	See Waste Abbreviations (pg. A29-A40).
Radiation Zone	An area containing radioactive materials in sufficient quantities to require controlling entry of personnel into the area.
Radiation	Particles and electromagnetic energy emitted by nuclear transformations that are capable of producing ions when interacting with matter.
Readily Available Risers	Risers with easily removable or no attached apparatus.
REC	Receive waste from another tank; see XFER.
REDOX	See Facilities (pg. A41).
Removed From Service (Tanks)	Any tank that is a confirmed leaker or is not intended for reuse.

Rerun Drywell Data	Surveillance data which supersedes "suspect data."
RES D	See Waste Abbreviations (pg. A29-A40).
RIX	See Waste Abbreviations (pg. A29-A40).
RMA	Remote mechanical "A" line; process used in Z Plant.
RMC	Remote mechanical "C" line; process used in Z Plant.
RSN	See Waste Abbreviations (pg. A29-A40).
RSS	See Waste Abbreviations (pg. A29-A40).
RTX	See Waste Abbreviations (pg. A29-A40).
S	Transaction Flag Key-partial neutralization (PNF).
S Plant (REDOX)	See Facilities (pg. A41).
S1 SLTCK	See Waste Abbreviations (pg. A29-A40).
S2 SLTSLRY	See Waste Abbreviations (pg. A29-A40).
Saltcake	Crystallized nitrate and other salts deposited in waste tanks, usually after measures are taken to remove moisture.
Saltwell	A hole drilled or sluiced into a saltcake and lined with a cylindrical screen to permit drainage and jet pumping of interstitial liquors.
SCAV	Scavenging campaign with FECN on TBP, 1952-57. See TOO-T##, POO-P##.
Scavenged	Waste which has been treated with ferrocyanide to remove cesium from the supernatant by precipitating it into the sludge.
Scintillation Monitor	A radiation detection instrument based on the principle that light pulses are produced in some materials when they are exposed to radiation.

Self Concentrating	Liquid, high-level radioactive waste whose decaying radionuclides heat the solution sufficiently to boil off the water, thus concentrating the waste.
Self-Evaporation	A waste material in which moisture is lost as the liquid changes to a vapor and diffuses into the atmosphere.
SET	Connect cascaded tanks together; see CAS and END.
SIX	See Waste Abbreviations (pg. A29-A40).
SL	See Waste Abbreviations (pg. A29-A40).
SL3SY	See Waste Abbreviations (pg. A29-A40).
Sludge	Mainly insoluble metal hydroxides and oxides precipitated from neutralized waste.
Slugs	An early term for uranium fuel elements which had been machined or extruded into short cylinders which were then clad or encased in corrosion-resistant metals.
Sluicing, or sluiced	To wash with water. At Hanford, this has meant to dissolve or suspend waste in solution using a high pressure water stream.
Slurry	Insoluble material suspended in water or aqueous solution.
SMP	Sludge measuring port
Solids Level Best Engineering Judgement Line	During the initial filling of certain single-shell tanks, only the liquid level was reported. To adjust for the abrupt increase in solids level when data for solids were added to the record, a sloped line was used to reflect solids volume between the initial fill and the time the solids data were recorded.
Sound Tank	The classification of a waste storage tank for which surveillance data indicate no loss of liquid attributed to a breach of integrity.

SPRG	Sparge-transfer of water or volume
SRR	See Waste Abbreviations (pg. A29-A40).
SRS	See Waste Abbreviations (pg. A29-A40).
SST	Single-shell tank
SSW	See Waste Abbreviations (pg. A29-A40).
STAB	Tank stabilized by removal of liquid. Both floating suction and saltwell jet pumps are used to remove liquid.
Stabilization	The removal or immobilization, as completely as possible, of the liquid contained in a radioactive waste storage tank by saltwell pumping, open hole saltwell pumping, adding diatomaceous earth, etc.
Static Tank	A tank with no significant change in liquid level or involvement in transfer operations during a stated period of time.
Strontium Semiworks	C Plant or Hot Semiworks; was a pilot plant for both REDOX and PUREX, then was reconfigured for strontium recovery.
SU	See Waste Abbreviations (pg. A29-A40) and supernatant.
Supernatant	The liquid quantity defined by the difference between the measured liquid level and the measured average solids level in a waste storage tank.
Surveillance	Regular or systematic watch kept over someone or something.
Suspect Data	Surveillance data which does not fall within the expected range and is superseded by "reruns."
SV	Transaction Flag Key-amount by difference in solids.
SW RCR	Saltwell receiver
SWLIQ	See Waste Abbreviations (pg. A29-A40).

SWLQW	See Waste Abbreviations (pg. A29-A40).
T Plant (222-T)	See Facilities (pg. A41).
T1 SLTCK	See Waste Abbreviations (pg. A29-A40).
T2 SLTCK	See Waste Abbreviations (pg. A29-A40).
Tank Farm	An area containing a number of aboveground or underground storage tanks for storing chemicals, petroleum products, or waste.
TBP	Tributyl phosphate, a solvent used in the PUREX solvent extraction process. Also, see Waste Abbreviations.
TCO	See Waste Abbreviations (pg. A29-A40).
Terminal Liquor	The liquid product from the evaporation-crystallization process which, upon further concentration, formed a solid that was unacceptable for storage in single-shell tanks. Terminal liquor was characterized by a caustic concentration of approximately 5.5 M (the caustic molarity was lower if the aluminum salt saturation was reached first).
TFeCN	See Waste Abbreviations.
TH	See Waste Abbreviations.
Thermocouple	A probe for measuring temperature, consisting of two dissimilar metal wires joined at one end (hot junction) with the free ends joined to a measuring instrument. Changes in electrical potential due to temperature changes at the hot end are measured and calibrated to read out as temperature.
Thermocouple Tree	A group of thermocouples assembled in a pipe and inserted into a waste tank for measuring temperatures at regular vertical intervals.
Thermowell	A well in a waste tank which contains thermocouples.
THL	See Waste Abbreviations (pg. A29-A40).

Thorium	A chemical element which is a fertile material. Fertile means that when it is subjected to radiation in a nuclear reactor, it will be converted, in this case, to ^{233}U , a potential fuel.
TK	Tank. However, TK-17-2 was an early name for B Plant.
TL	See Waste Abbreviations (pg. A29-A40).
TMACS	Tank monitor and control system
TOO-T##	In-tank scavenging with FECN; see SCAV, POO-P##.
TPLAL	See Waste Abbreviations (pg. A29-A40).
TPLAN	See Waste Abbreviations (pg. A29-A40).
TPLAS	See Waste Abbreviations (pg. A29-A40).
TR	Transfer from tank
Trench	A deep furrow in the ground. At Hanford, they are used for the disposal of solid waste.
trFlag	Transaction Flag Keys (used by Wtrac)—see CDF, D, E, S, SV, 1, 3, 6, 0.17, 0.33.
Tributyl Phosphate (TBP)	A chemical compound, an organic solvent, used in the PUREX solvent extraction process.
TRUEX	Transuranic extraction process
Type I Tank	These are the 200 series tanks found in B, C, T, and U Tank Farms. They have an operating capacity of 55,000 gallons, a 20-foot diameter, a six-inch deep dish bottom, and a three-foot knuckle. Generation is not associated with Type I tanks.
Type II Tank	These are the original (1st generation) tank designs, which are found in B, C, T, U (excluding the 200 series tanks), and BX Tank Farms. See 1st Generation Tank.

Type III Tank	These are the 2nd Generation tank designs, which are found in BY, S, TX, and TY Tank Farms. See 2nd Generation Tank.
Type IV Tank	These are 3rd, 4th, and 5th generation tank designs found in SX, A, and AX Tank Farms, respectively. See 3rd, 4th, and 5th Generation Tanks.
Type V Tank	These are the first double shell tank designs, which are found in AY, AZ, and SY Tank Farms.
U Plant (222-U)	See Facilities (pg. A41).
U1U2	See Waste Abbreviations (pg. A29-A40).
UNKN	Unknown waste origin sink
UNKNOWN, UNK	See Waste Abbreviations (pg. A29-A40).
UR	Uranium recovery operation in 222-U, 1952-57. Created TBP (primary waste, also known as UR) and FECN (scavenging wastes). See TFeCN, PFeCN, POO-P##, TOO-T##, FeCN, and Waste Abbreviations (pg. A29-A40).
Watch List Tank	An underground storage tank requiring special safety precautions because the tank potentially could release high-level radioactive waste if there are uncontrolled increases in temperature or pressure. Special restrictions have been placed on these tanks by "Safety Measures for Waste Tanks at Hanford Nuclear Reservation," Section 3137, National Defense Authorization Act for Fiscal Year 1991, November 5, 1990, Public Law 101-501 (also known as the Wyden Amendment).
WATER	Flush water from various sources
WTR	Water
WWTR	Waste water
WVP	Waste volume projections
XFER	Transfer of waste out of tank

Z	See Waste Abbreviations (pg. A29-A40).
Z Plant	Plutonium Finishing Plant (PFP); see Facilities (pg. A41).
ZAW	See Waste Abbreviations (pg. A29-A40).
ZHIGH	See Waste Abbreviations (pg. A29-A40).
ZLAB	See Waste Abbreviations (pg. A29-A40).
ZLOW	See Waste Abbreviations (pg. A29-A40).
ZPRFL	See Waste Abbreviations (pg. A29-A40).
ZPRFS	See Waste Abbreviations (pg. A29-A40).
ZRM	See Waste Abbreviations (pg. A29-A40).
ZRMCL	See Waste Abbreviations (pg. A29-A40).
ZRMCS	See Waste Abbreviations (pg. A29-A40).

This page left intentionally blank.

Waste Abbreviations

1AYIN	Concentrated complexed waste from Tank 241-AY-101 inventory
1AZIN	Pre-February 1981 Tank 241-AZ-101 inventory
1C	First-cycle decontamination waste from the BiPO_4 process
1C1	First-cycle decontamination waste from the BiPO_4 process, 1944-51 (LANL defined waste #3)
1C2	First-cycle decontamination waste from the BiPO_4 process, 1952-56 (LANL defined waste #4)
1CEB	First-cycle evaporator bottoms
1CS	First-cycle scavenging waste
1CFecN	First-cycle ferrocyanide scavenging waste (LANL defined waste #12)
224, 224-F	LaF_3 finishing waste from BiPO_4 process and uranium recovery (also known as 224-U waste) in the 224 buildings by T Plant and B Plant and the Plutonium Finishing Plant (LANL defined waste #7)
231Z	Dilute phosphate waste from 231-Z laboratories
2AYIN	Pre-February 1981 Tank 241-AY-102 inventory
2AZIN	Pre-February 1981 concentrated complexed waste from Tank 241-AZ-102 inventory
2C	Second-cycle decontamination waste from the BiPO_4 process
2C1	Second-cycle decontamination waste from the BiPO_4 process, 1944-51 (LANL defined waste #5)
2C2	Second-cycle decontamination waste from the BiPO_4 process, 1952-56 (LANL defined waste #6)

Waste Abbreviations

2SYIN	Pre-February 1981 Tank 241-SY-102 inventory
3AWIN	Pre-February 1981 Tank 241-AW-103 inventory
5-6	Waste from cell 5 tank 6 in B Plant
5AWIN	Pre-February 1981 Tank 241-AW-105 inventory
6AWIN	Concentrated phosphate waste from Tank 241-AW-106 inventory
A1 SLTCK	Saltcake waste generated from the 242-A Evaporator-crystallizer, 1977-80 (LANL defined waste #45)
A2 SLTSLRY	Salt slurry waste generated from the 242-A Evaporator-crystallizer, 1981-94 (LANL defined waste #46)
AGE, AGING	Aging waste
AR	"Washed" PUREX sludge from the 244-AR vault (LANL defined waste #31)
B	B Plant high-level waste from PAW processed through B Plant to extract strontium (LANL defined waste #32)
B SLTCK	Saltcake waste generated from the 242-B Evaporator, 1951-55 (LANL defined waste #38)
B860N	Dilute non-complexed waste from B Plant cell drainage
BFSH	B Plant flush waste water
BL	B Plant low-level waste (LANL defined waste #33)
BLEB	B Plant low-level evaporator bottoms
BLIX	B Plant low level ion exchange?
BLIXB	B Plant low level ion exchange bottoms?
BNW	Battelle Northwest Laboratory waste

Waste Abbreviations

BPDC	Dilute complexed waste from B Plant cesium processing
BPDCS	Dilute complexed waste from B Plant strontium processing
BPDCV	Dilute complexed waste from B Plant vessel clean-out
BPFP	B Plant TRU solids from retrieved PFP solids
BPLCS	Dilute non-complexed waste from B Plant strontium processing
BPLDC	Dilute complexed waste from B Plant cesium processing
BPLDN	Dilute non-complexed waste from B Plant cesium processing
BVCLN	Dilute non-complexed waste from B Plant vessel clean-out
BY SLTCK	Saltcake waste generated from in-tank solidification units 1 and 2, 1965-74 (LANL defined waste #42)
CARB	Organic wash waste from PUREX
CC	Complexant concentrate waste or concentrated complexant; concentrated product from evaporating dilute complexed waste
CCGL	B Plant high TRU solids from retrieved complexant concentrate
CCGR	Dilute non-complexed waste from retrieved complexant concentrate
CCPL, CCPLX	Complexant concentrate; See CPLX
CCW	Concentrated customer waste
CE	Evaporator concentrate
CEM	Concrete; see CON
CF	Cesium feed; see CSFD

Waste Abbreviations

CON	Concrete; see CEM
CP	Concentrated phosphate waste from N Reactor decontamination
CPLX	Complexed waste
CSFD	Cesium feed from B Plant
CSR	Waste (supernatant) from cesium recovery at B Plant (LANL defined waste #35)
CSS, CS Solids	Concentrated supernatant solids
CST	Caustic solution
CSWLE	Complexed saltwell liquid from the 200-East Area
CSWLW	Complexed saltwell liquid from the 200-West Area
CW	Coating (cladding) waste
CW/ZR1	Coating (cladding) waste (PUREX), Zircaloy cladding (LANL defined waste #23)
CW/ZR2	Coating (cladding) waste (PUREX), Zircaloy cladding (LANL defined waste #49); see NCRW and PD; also known as CWP/ZR2
CWP	Coating (cladding) waste (PUREX); see NCRW; (LANL defined waste #21; CWP/A1 1956-60)
CWP2	Cladding (coating) waste (PUREX), (LANL defined waste #22, CWP/A1 1961-72)
CWR	Coating (cladding) waste (REDOX)
CWR1	REDOX cladding (coating) waste, (LANL defined waste #15; CWR/A1 1952-60)
CWR/A1	Coating (cladding) waste (REDOX), (LANL defined waste #16; 1961-67)
CX70	Dilute complexed mixture hot-semiworks TRU solids

Waste Abbreviations

DC	Dilute complexed waste
DE	Diatomaceous earth waste
DN	Dilute non-complexed waste
DN/PD	DN with P TRU solids
DN/PT	DN with PFP TRU solids
DSS	Double-shell slurry; same as salt slurry
DSSF	Double-shell slurry feed; supernatant of salt slurry
DDSSF	Dilute double-shell slurry feed
DUMM, DUMMY	Dummy waste
DW	Decontamination waste (LANL defined waste #36)
DWBIX	Decontamination waste and B Plant ion exchange
EB	Evaporator bottoms
EF, EVFD	Evaporator feed
EFD	Evaporator feed dilute
EVAP	Evaporator feed (post 1976)
EVAPF	Dilute non-complexed waste from evaporator pad flush
FD	Feed dilute
FLSH	Flush water
FP	Fission products waste
HDRL	Hanford defense residual liquor
HFW	Hanford facility waste
HLO	Hanford laboratory operations waste
HLW	High-level waste; generic for all Hanford tank wastes

Waste Abbreviations

HS	Hot or Strontium Semiworks waste (LANL defined waste #28); see SSW
IWW	Inorganic wash waste (i.e., concentrated neutralized high-level waste from PUREX); see NCAW and P
IX	Ion exchange waste
L222S	222-S laboratory, dilute non-complexed waste
L3A4A	Dilute non-complexed laboratory wastes from 300 and 400 Areas
LaF	Lanthanum fluoride (LaF_3) finishing waste generated in PFP
LUNC	Dilute non-complexed waste from UNC fuels fabrication?
LW	Laboratory waste
MW	Metal waste
MW1	Metal waste from BiPO_4 , 1944-51 (LANL defined waste #1, same as MW)
MW2	Metal waste from BiPO_4 , 1952-56 (LANL defined waste #2, same as MW)
MWF	Metal waste feed
N	N Reactor decontamination waste (LANL defined waste #37)
NCAW	Neutralized current acid waste, primary HLW stream from PUREX process
NCPL, NCPLX, NCPLX	Non-complexed waste
NCRW	Neutralized cladding removal waste, same as CWP
NFAW	Aging waste from PUREX/PFM high level waste
NHAW	Aging waste from PUREX/PFM processing of N production reactor (NPR) fuel

Waste Abbreviations

NRAW	Aging waste from PUREX/PFM residue acid waste
NRP82	Dilute non-complexed waste from FY82 100-N Area waste transfer
NRPO4	Dilute phosphate waste from 100-N Area
NRSO4	Dilute non-complexed waste from 100-N Area
OWW	Organic wash waste from PUREX [includes LANL defined wastes #24, 1956-62 (also known as CARB); #25, 1963-67, and #26, 1968-72]
P	PUREX high-level waste or neutralized. PUREX acid waste
P1	PUREX high-level waste, 1955-62 (LANL defined waste #17)
P2	PUREX high-level waste, 1963-67 (LANL defined waste #18)
P3	PUREX high-level waste, 1983-88 (LANL defined waste #47)
PADFG	PUREX ammonia destruction waste from fuels grade fuel
PADWG	PUREX ammonia destruction waste from weapons grade fuel
PAS	PUREX acidified sludge
PASF	PUREX ammonia scrubber feed (LANL defined waste #50)
PAW	PUREX acidified waste
PD	PUREX decladding waste
PDBNG	Decladding sludge (non-TRU) from B Plant processing
PDBSU	Dilute non-complexed waste from B Plant decladding waste

Waste Abbreviations

PDBTG	B Plant aging waste solids from PUREX decladding waste
PDCSS	Dilute non-complexed PUREX decladding waste, FY1986 only
PDL87	PUREX decladding supernatant, 1987
PDL89	PUREX decladding supernatant, non-TRU, spent metathesis removed
PDNSG	Non-TRU decladding sludge from PUREX
PDS87	PUREX decladding sludge, 1987
PDS89	PUREX decladding sludge after FY89
PDSLQ	PUREX decladding sludge
PDSUP	Dilute non-complexed waste, PUREX decladding waste
PFeCN	Ferrocyanide sludge produced by in-plant scavenging of waste from uranium recovery
PFeCN1	Ferrocyanide sludge produced by in-plant scavenging (using 0.005 M ferrocyanide) of waste from uranium recovery (LANL defined waste #9)
PFeCN2	Same as PFeCN1 except 0.0025 M ferrocyanide used (LANL defined waste #10)
PFM	Waste from the process facility modification of PUREX
PFMMS	Dilute non-complexed waste from shear/leach processing of NPR fuel
PFPGP	Dilute non-complexed waste from retrieved PFP solids
PFpNT	Non-TRU sludge from the PFP (Z Plant)
PFpPT	Dilute non-complexed waste from the PFP (with TRUEX)
PFpSL	TRU sludge from the PFP (Z Plant)

Waste Abbreviations

PL	PUREX low-level waste
PL1	PUREX low-level waste (LANL defined waste #20)
PL2	PUREX low-level waste, 1983-88 (LANL defined waste #48)
PML89	PUREX spent metathesis liquid after FY89
PMS89	PUREX spent metathesis solids after FY89
PN	PUREX neutralized cladding waste
PNF	Partially neutralized waste
PSL	PUREX sludge sluiced during recovery of strontium
PSS	PUREX sludge supernatant
PSSF	PUREX sludge supernatant feed
PT	TRU solids from 200-West Area
PX86S	Dilute non-complexed waste from PUREX miscellaneous streams (NPR fuel) FY86
PXBAW	B Plant aging waste supernatant from retrieved aging waste
PXBSG	B Plant aging waste solids from retrieved aging waste
PXFTF	Dilute non-complexed waste from PUREX miscellaneous streams (FFTF)
PXLOW	PUREX low level waste
PXMET	PUREX dilute non-complexed decladding; spent metathesis
PXMSC	Dilute non-complexed waste from PUREX miscellaneous streams (NPR fuel)
PXNAW	Aging waste from PUREX high level waste
R	REDOX waste

Waste Abbreviations

R SLTCK	Saltcake waste from the REDOX concentrator (LANL defined waste #40)
R1	REDOX waste, 1952-57 (LANL defined waste #13, same as R)
R2	REDOX waste, 1958-66 (LANL defined waste #14, same as R)
RESD	Residual evaporator liquor
RIX	REDOX ion exchange waste
RSN	REDOX supernatant
RSS	REDOX sludge supernatant
RTX	REDOX ion exchange
S1 SLTCK	Saltcake waste generated from the 242-S Evaporator-crystallizer, 1973-76 (LANL defined waste #43)
S2 SLTSLRY	Salt slurry waste generated from the 242-S Evaporator-crystallizer, 1977-80 (LANL defined waste #44)
SIX	PUREX ion exchange waste
SL	Sludge
SL3SY	Double shell slurry from late FY80, Tank 241-SY-103 inventory
SRR	Waste sent to B Plant for strontium recovery from sluiced P sludge (LANL defined waste #34)
SRS	Strontium sludge
SRS	Strontium recovery supernatant
SSW	Strontium Semiworks waste
SU	Supernatant
SWLIQ	Dilute non-complexed waste from 200-East Area single shell tanks

Waste Abbreviations

SWLQW	Dilute non-complexed waste from 200-West Area single shell tanks
T1 SLTCK	Saltcake waste generated from the 242-T Evaporator, 1951-55 (LANL defined waste #39)
T2 SLTCK	Saltcake waste generated from the 242-T Evaporator, 1965-55 (LANL defined waste #41)
TBP	Tri-butyl phosphate; also known as uranium recovery waste (UR)
TCO	Dilute non-complexed waste from terminal cleanout
TFeCN	Ferrocyanide sludge produced by in-tank or in-farm scavenging (LANL defined waste #11)
TH	Thoria HLW or cladding waste
TH66	Thoria HLW or cladding waste (LANL defined waste #29)
TH70	Thoria HLW or cladding waste (LANL defined waste #30)
THL	Thoria low-level waste
TL	Terminal liquor
TPLAL, TPLAN	Dilute non-complexed waste from T Plant
TPLAS	Sludge from T Plant operations
U1U2	Dilute non-complexed waste from U1/U2 pumping of ground water
UNKNOWN, UNK	Unknown waste type (LANL defined waste)
UR	Uranium recovery waste (LANL defined waste #8); also known as tributyl phosphate (TBP) waste
Z	Z Plant (PFP) waste (LANL defined waste #27)
ZAW	PUREX waste from zircaloy clad fuel

Waste Abbreviations

ZHIGH	Dilute non-complexed waste from the PFP (without TRUEX)
ZLAB	Dilute non-complexed waste from the PFP laboratories
ZLOW	Dilute non-complexed waste from before FY85 Z Plant operations
ZPRFL	Dilute non-complexed waste from PRF processing
ZPRFS	PFP TRU solids from PRF processing
ZRMCL	Dilute non-complexed waste from PFP RMC processing
ZRMCS	PFP TRU solids from PFP RMC processing

Facilities

A Plant (PUREX)	This facility contained the latest solvent extraction process for recovery of both plutonium and uranium.
B Plant (222-B)	One of the three original bismuth-phosphate processing facilities, later converted to a waste fractionation plant.
C Plant (222-C)	Initially a pilot plant for REDOX, later a pilot plant for PUREX and B Plant waste partitioning.
S Plant (REDOX)	This facility contained the original extraction process for recovery of both plutonium and uranium.
T Plant (222-T)	One of the three original bismuth-phosphate processing facilities, later converted to a decontamination facility.
U Plant (222-U)	One of the three original bismuth-phosphate processing facilities, later converted to a uranium recovery plant.
PFP (Z Plant)	Plutonium Finishing Plant (234-5Z) where the final operations occurred for production of plutonium products.
242-A	A forced circulation vacuum evaporation system.
242-B	An evaporator that operates at atmospheric pressure; also referred to as an open air type evaporator.
242-S	A forced circulation vacuum evaporation system.
242-T	An evaporator that operates at atmospheric pressure; also referred to as an open air type evaporator.

Mulvey, C.A., January 1978–December 1978, *Waste Status Summary*, RHO-CD-14, Rockwell Hanford Operations, Richland, Washington.

Peterson, D.E., June 1954–May 1955, *Waste Status Summary - Separations Section*, HW-32389 etc., General Electric Company, Richland, Washington.

Peterson, D.E., June 1955–May 1956, *Waste Status Summary - Separations Section*, HW-38000 etc., General Electric Company, Richland, Washington.

Peterson, D.E., September 1956–December 1956, *Waste Status Summary - Chemical Processing Department*, HW-45738 etc., General Electric Company, Richland, Washington.

Peterson, D.E., June 1956–August 1956, *Waste Status Summary - Separations Section*, HW-43895 etc., General Electric Company, Richland, Washington.

Pines, A.G., January 4, 1991, *244-AR Vault Safety Analysis Report*, SD-WM-SAR-018, Rev. 0, Westinghouse Hanford Company, Richland, Washington.

Prosk, W. and D.A. Smith, January 1986, *Tank Isolation Safety Analysis Report*, SD-WM-SAR-006, Rev. 1, Rockwell Hanford Operations, Richland, Washington.

RHO, June 1977–October 1981, *Waste Status Summary, Monthly Reports*, RHO-CD-14, Rockwell Hanford Operations, Richland, Washington.

RHO, November 1981–June 1987, *Waste Status Summary, Monthly Reports*, RHO-RE-SR-014, Rockwell Hanford Operations, Richland, Washington.

Roberts, R.E., January 1957–December 1957, *Waste Status Summary - Chemical Processing Department*, HW-48144 etc., General Electric Company, Richland, Washington.

Roberts, R.E., January 1958–October 1958, *Waste Status Summary - Chemical Processing Department*, HW-54916 etc., General Electric Company, Richland, Washington.

Roberts, R.E., January 1961–December 1961, *Waste Status Summary - Chemical Processing Department*, HW-71610 etc., General Electric Company, Richland, Washington.

Roberts, R.E., January 1962–December 1962, *Waste Status Summary - Chemical Processing Department*, HW-74647 etc., General Electric Company, Richland, Washington.

Roberts, R.E., January 1963–December 1963, *Waste Status Summary - Chemical Processing Department*, HW-78279 etc., General Electric Company, Richland, Washington.

Roberts, R.E., January 1964–December 1964, *Waste Status Summary - Chemical Processing Department*, HW-83308 etc., General Electric Company, Richland, Washington.

Roberts, R.E., January 1965–December 1965, *Waste Status Summary - Chemical Processing Department*, HW-83906 etc., General Electric Company, Richland, Washington.

Roberts, R.E., October 1966–December 1966, *Waste Status Summary - Chemical Processing Division*, ISO-674, Isochem Inc., Richland, Washington.

Roberts, R.E., January 1966–September 1966, *Waste Status Summary - Chemical Processing Department*, HW-83906 etc., General Electric Company, Richland, Washington.

Rodenhizer, D.G., September 30, 1987, *Hanford Waste Tank Sluicing History*, SD-WM-TI-302, Westinghouse Hanford Company, Richland, Washington.

Rutherford, M.J., August 31, 1948, *Additional Waste Storage Facilities 200-East Area*, Specification No. HW-3783, General Electric Company, Richland, Washington.

Scaief, C.C. III, October 19, 1993, *TMACS I/O Termination Point Listing*, WHC-SD-WM-TI-594, Rev. 0, Westinghouse Hanford Company, Richland, Washington.

Smith, D.A., August 1986, *SAR, Hazard Identification and Evaluation for Nonstabilized Single-Shell Tanks*, SD-WM-SAR-022, Rev. 0, Rockwell Hanford Operations, Richland, Washington.

Stahl, S.M., November 22, 1993, *Hanford Site Tank Farm Facilities Interim Safety Basis*, Volume 1 and 2, WHC-SD-WM-ISB-001, Westinghouse Hanford Company, Richland, Washington.

Stong, F.S., September 29, 1986, *Drywell Van In-Tank Liquid Observation Well Surveillance Data Interpretation*, RHO-SD-WM-TI-237, Rockwell Hanford Operations, Richland, Washington.

Thress, M.A., November 1958–February 1959, *Waste Status Summary - Chemical Processing Department*, HW-58579 etc., General Electric Company, Richland, Washington.

Thurman, J.M., June 1987–December 1987, *Tank Farm Surveillance and Waste Status Summary Report, Monthly Reports* WHC-SP-0038, Westinghouse Hanford Company, Richland, Washington.

Thurman, J.M., December 1987–June 1993, *Tank Farm Surveillance and Waste Status Summary Report, Monthly Reports*, WHC-EP-0182-55, Westinghouse Hanford Company, Richland, Washington.

Thurman, J.M., February 1987–June 1987, *Waste Status Summary*, RHO-RE-SR-14, Rockwell Hanford Operations, Richland, Washington.

Thurman, J.M., July 1987–March 1988, *Waste Status Summary*, WHC-SP-0038, Westinghouse Hanford Company, Richland, Washington.

Thurman, J.M., April 1988–December 1988, *Tank Farm Surveillance and Waste Status Summary Report*, WHC-EP-0182, Westinghouse Hanford Company, Richland, Washington.

Thurman, J.M., January 1989–October 1989, *Tank Farm Surveillance and Waste Status Summary Report*, WHC-EP-0182, Westinghouse Hanford Company, Richland, Washington.

Tran, T.T., April 27, 1993, *Thermocouple Status Single-Shell and Double-Shell Waste Tanks*, WHC-SD-WM-TI-553, Rev. 0, Westinghouse Hanford Company, Richland, Washington.

U.S. DOE, December 1987, *EIS, Disposal of Hanford Defense High Level, Transuranic, and Tank Wastes*, DOE/EIS-0113, Volumes 1-5, Department of Energy, Richland, Washington.

Uebelacker, D.L., October 1968–December 1968, *Waste Status Summary - Chemical Processing Division*, ARH-1061, Atlantic Richfield Hanford Company, Richland, Washington.

Uebelacker, D.L., January 1969–December 1969, *Waste Status Summary - Chemical Processing Division*, ARH-1200, Atlantic Richfield Hanford Company, Richland, Washington.

Uebelacker, D.L., January 1970–December 1970, *Waste Status Summary - Chemical Processing Division*, ARH-1666, Atlantic Richfield Hanford Company, Richland, Washington.

Vail, T.S., January 1985–March 1986, *Waste Status Summary*, RHO-RE-SR-14, Rockwell Hanford Operations, Richland, Washington.

Wagoner, J.D., March 18, 1993, *Wyden Request*, Document No. 9301156B R3, U.S. Department of Energy, Richland, Washington.

Waite, J.L., April 1991, *Tank Wastes Discharged Directly to the Soil at the Hanford Site*, WHC-MR-0227, Westinghouse Hanford Company, Richland, Washington.

Welty, R.K., September 1988, *Waste Storage Tank Status and Leak Detection Criteria*, WHC-SD-WM-TI-356, Volumes 1 and 2, Westinghouse Hanford Company, Richland, Washington.

Welty, R.K. and N.J. Vermeulen, September 12, 1989 with ECN's through November 8, 1993, *Waste Storage Tank Status and Leak Detection Criteria*, WHC-SD-WM-TI-357, Rev. 1K, Westinghouse Hanford Company, Richland, Washington.

WHC, September 1991, *Failure to Continuously Man Control Room During Transfer Per Procedure*, Occurrence Report RL--WHC-Tank Farm-1991-1019, Westinghouse Hanford Company, Richland, Washington.

WHC, July 1991, *High Radiation Readings in 241-BY Drywells*, Occurrence Report RL--WHC-Tank Farm-1991-1022, Westinghouse Hanford Company, Richland, Washington.

WHC, August 1993, *Hanford Site Tank Farm Facilities Interim Safety Basis*, WHC-SD-WM-ISB-001, Rev. 1, Volumes 1 and 2, Westinghouse Hanford Company, Richland, Washington.

WHC, March 1993, *Hanford Watchlist Tank Surveillance Trends*, Letter to the Honorable Ron Wyden, Westinghouse Hanford Company, Richland, Washington.

WHC, July 1993, *Unauthorized Water Usage at 241-BY Tank Farm Results in Exceeding Raw Water Operational Limit*, Occurrence Report RL--WHC-Tank Farm-1993-0050, Westinghouse Hanford Company, Richland, Washington.

Winters, W.I., L. Jensen, L.M. Sasaki, R.L. Weiss, J.F. Keller, A.J. Schmidt, and M.G. Woodruff, May 1989, *Waste Characterization Plan for the Hanford Site Single-Shell Tanks*, WHC-EP-0210, Westinghouse Hanford Company, Richland, Washington.

Wood, S.A., May 1993, *Waste Tank Evaporation Water Loss Computer Program*, WHC-SD-WM-CSWD-055, Rev. 0., Westinghouse Hanford Company, Richland, Washington.

7. Abstract

Historical Tank Content Estimate of the Southeast Quadrant provides historical evaluations on a tank by tank basis of the radioactive mixed wastes stored in the underground double-shell tanks of the Hanford 200 East and West Areas. This report summarizes historical information such as waste history, temperature profiles, psychrometric data, tank integrity, inventory estimates and tank level history on a tank by tank basis. Tank Farm aerial photos and in-tank photos of each tank are provided. A brief description of instrumentation methods used for waste tank surveillance are included. Components of the data management effort, such as Waste Status and Transaction Record Summary, Tank Layer Model, Supernatant Mixing Model, Defined Waste Types, and Inventory Estimates which generate these tank content estimates, are also given in this report.

Psychrometric Data

**THIS PAGE INTENTIONALLY
LEFT BLANK**

**241-AP-101
Tank Evaporation Rate**

Data Obtained from WHC Surveillance, January 16, 1995.

241-AP-101
Heat Transfer Rate To Tank Ventilation System

Data obtained from WHC Surveillance, January 15, 1995.

241-AP-101
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-101
Heat Transfer Rate To Annulus Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-101
Annulus Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-102
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-102
Heat Transfer Rate To Tank Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-102
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-102
Heat Transfer Rate To Annulus Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-102
Annulus Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-103
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-103
Heat Transfer Rate To Tank Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-103
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-103
Heat Transfer Rate To Annulus Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-103
Annulus Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-104
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-104
Heat Transfer Rate To Tank Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-104
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-104
Heat Transfer Rate To Annulus Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-104
Annulus Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-105
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-105
Heat Transfer Rate To Tank Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-105
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-105
Heat Transfer Rate To Annulus Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-105
Annulus Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

**241-AP-106
Tank Evaporation Rate**

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-106
Heat Transfer Rate To Tank Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-106
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-106
Heat Transfer Rate To Annulus Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-106
Annulus Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-107
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-107
Heat Transfer Rate To Tank Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-107
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-107
Heat Transfer Rate To Annulus Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-107
Annulus Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-108
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-108
Heat Transfer Rate To Tank Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-108
Tank Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-108
Heat Transfer Rate To Annulus Ventilation System

Data obtained from WHC Surveillance, January 16, 1995.

241-AP-108
Annulus Evaporation Rate

Data obtained from WHC Surveillance, January 16, 1995.

APPENDIX K

Tank Layering Comparison and Data

THIS PAGE INTENTIONALLY
LEFT BLANK

The following table describes the column headings for the Tank Layer Model developed by Los Alamos National Laboratories and the column headings correspond with the tables presented in this appendix.

Column Heading	Description
Tank	tank number
Year	year of last primary addition and year of solid measurement
Qtr	quarter of last primary addition and quarter of solid measurement
Meas, solids	reported solids from Anderson-91 in kgal
Solids change	calculated solids based on primary fill record or difference between solids records
Pred layer	predicted layer now in tank in kgal
Layer type	Defined Waste Type for that layer
Waste volume	summation of primary waste additions calculated for this period
Comments	various details of each calculation

Tank Layer Model for SE Quadrant
