QUARTERLY ENVIRONMENTAL DATA SUMMARY (QEDS) FOR FOURTH QUARTER 1998

In support of the Weldon Spring Site Remedial Action Project Federal Facilities Agreement, a copy of the Quarterly Environmental Data Summary (QEDS) for the fourth quarter of 1998 is enclosed.

The data presented in this letter and attachment constitute the QEDS. The data, except for air monitoring data and site KPA generated data (uranium analyses) were received from the contract laboratories, verified by the Weldon Spring Site verification group, and merged into the database during the fourth quarter of 1998. KPA results for on-site total uranium analyses performed during fourth quarter 1998 are included. Air monitoring data presented are the most recent complete sets of quarterly data.

Significant data, defined as data values that have exceeded defined "above normal" Level 2 values, are discussed in this letter for Environmental Monitoring Plan (EMP) generated data only. Above normal Level 2 values are based, in ES&H procedures, on historical high values, DOE Derived Concentration Guides (DCGs), NPDES limits and other guidelines. The procedures also establish actions to be taken in the event that "above normal" data occur.

All data received and verified during the fourth quarter were within a permissible range of variability except for those detailed below. Above normal occurrences are cited for groundwater and NPDES data. There were none for air, springs, or surface water. The following discussion offers a brief summary of the data merged during the fourth quarter that exceeded the above normal criteria, and updates on past reported above normal data. The attached tables present the most recent data for air and the data merged into the database during the fourth quarter 1998 for groundwater, NPDES, surface water, and springs.

Graphs showing concentrations of selected contaminants of concern at some of the critical locations have also been included in this QEDS. The graphs are discussed in the separate sections.

NPDES

The uranium concentrations at the three major NPDES outfalls are graphed from October 1997 to December 1998. The graphs are located at the beginning of the NPDES tables. For comparison purposes, the annual averages for 1997 and 1998 are also graphed. The derived concentration guide (DCG) of 600 pCi/l for uranium may also be used for comparison. The DCG is the concentration of a radionuclide in air or water that, under conditions of continuous exposure for 1 year by one exposure mode (i.e., ingestion of water) would result in an effective dose equivalent of 100 mrem. A graph of historical annual averages for the three outfalls is also attached.

Outfall NP-0002 was slightly above the 1997 annual average for uranium (14 pCi/l) for November at 16.6 pCi/l and below for the months of October and December. The 1998 annual average is 22 pCi/l, which is slightly higher than the 1997 average and can be attributed to natural variations (rainfall, etc). Most of the NP-0002 watershed has been remediated and uranium levels are expected to stay well below the pre remediation levels.

The uranium levels at NP-0003 were well below the 1997 annual average (143 pCi/l) for the three months of the quarter. The 1998 annual average of 83 pCi/l is a substantial decrease over the 1997 annual average. While most of the Outfall NP-0003 watershed has been remediated, it contains Ash Pond where contaminated soils, concrete, etc., were being stored. Most of these materials have been placed in the disposal cell and all that remains is what was in Ash Pond before remediation started. Water is released from the Ash Pond area only if it is less than 600 pCi/l for uranium. However, it is possible that subsequent uranium levels could be higher than the previous Outfall NP-0003 annual average, which could cause an increase in the current annual average. The volume of runoff from Ash Pond is low in comparison to the remainder of the watershed.

Outfall NP-0004 was added to the NPDES permit during May of 1998. The watershed that flows to the outfall includes the remediated section of Raffinate Pit 4. The maximum uranium level for the 3-month period was 2.93 pCi/l. Because NP-0004 is a small watershed the uranium data is not graphed.

Outfall NP-0005 was below the 1997 annual average for uranium (19 pCi/l) for the 3 months of the quarter. The 1998 annual average is 10 pCi/l which is a reduction from the 1997 average. A large portion of the NP-0005 watershed has been remediated and uranium levels are expected to remain well below pre-remediation levels.

Outfall NP-0010, the CMSA sedimentation basin outfall, was slightly above the 1997 annual average (2.7 pCi/l) for the months of October and November and slightly below for December. The area has been remediated and uranium levels are expected to

remain low, but the use of a small area for vehicle maintenance may increase uranium levels slightly. Because NP-0010 is a minor outfall it is not graphed.

Outfall NP-1005, the new storm water outfall at the quarry, discharged during November 1998 and was in compliance with all permitted parameters. The uranium level was 0.644 pCi/l.

The above normals for data merged during the fourth quarter and any above normals that were not resolved in previous QEDS are discussed below.

NP-0006-102298

A compliance sample for sewage treatment plant effluent was collected on October 22, 1998. The fecal coliform result was 3,900 colonies per 100 ml with a duplicate result of 4,680 colonies per 100 ml. The permitted daily maximum is 1,000 colonies per 100 ml. In accordance with permit standard condition Part 1, Section B.2.A, we reported the permit exceedance in writing within 5 days to the MDNR. Total Residual Chlorine (TRC) at 0.7 mg/l, pH at 7.32 units, BOD at < 5 mg/l, and TSS at 25 mg/l were all in compliance. No degradation of the receiving stream was noted. There appeared to be a small amount of fat or oil in the aeration chamber that may have had a detrimental effect on the treatment plant. The treatment process was evaluated and operational changes made to improve the disinfection process. Signs were also posted above all sinks stating that no fats or other oily substances were to be discarded down the sink drains. A subsequent sample collected on November 18, 1998, after the plant had stabilized, had a fecal coliform level of 21 colonies per 100 ml, which demonstrated that the effluent was back in compliance for fecal coliform.

NP-0004-110398

On November 3, 1998, a quarterly NPDES storm water compliance sample was collected at NPDES Outfall NP-0004. Settleable solids and pH analyses were conducted on site. The settleable solids were in compliance at <0.1 ml/l/hr with a permit limit of 1.0; however, the pH was out of compliance at 9.34 units (permitted range is 6.0 to 9.0 units). During the sampling event the sampler noted that concrete truck drivers working in the Raffinate Pit 4 area were washing off their concrete chutes in the NP-0004 watershed after discharging their loads. Concrete wash water is high in pH. PMC personnel were notified that discharging this water to the watershed was not acceptable and that it should be discharged where it would receive proper treatment.

The truck drivers were then immediately directed to wash their trucks so that the water would flow to Pit 4 where it will receive proper treatment. No detrimental effect on the receiving stream was noted. Subsequent samples collected on November 10 and December 21, 1998, were in compliance at 8.11 and 8.31 units, respectively.

NP-0004-073098

Parameters required for the application to renew NPDES permit MO-0107701 were sampled in the July 30, 1998, sample for Outfall NP-0004. Six metals (As, Cr, Cu, Pb, Ni and Zn) were above the 100 µg/l notification level for toxic pollutants. This was reported in the third quarter 1998 QEDS. HSL metals were sampled during subsequent sampling events on October 29, 1998, and November 3, 1998; in order to demonstrate that the elevated levels were caused by elevated solids when the July 30 sample was collected and that the levels were subsequently reduced as a result of actions taken by the PMC. The metals levels from the two subsequent samples were all well below the 100 µg/l notification level required for toxic pollutant metals. In addition, arsenic, chromium, lead and thallium were collected during the December 21, 1998, sampling event and were also well below the 100 µg/l notification level.

GROUNDWATER

Chemical Plant

Site Water Treatment Plant and Temporary Storage Area

One unfiltered groundwater sample exceeded baseline levels for chromium. As described below, reported concentrations of metals in the filtered replicate did not exceed baseline. Total uranium baselines were exceeded in fourth quarter samples from four locations. On site KPA results were used for comparisons to the off-site laboratory reported values and are described below. No groundwater impacts from the Site Water Treatment Plant or TSA are suspected.

- Sample # GW-2035-Q398

The third quarter 1998 chromium value (10.9 µg/l) was reported above baseline (4.21 µg/l). A filtered replicate of this sample had a value less than 1 µg/l.

- Sample # GW-2037-B598

Fourth quarter uranium (2.56 pCi/l) exceeded baseline (2.17 pCi/l). On site KPA for this sample (1.25 pCi/l) was below baseline.

- Sample # GW-2038-B598

Fourth quarter uranium (4.02 pCi/l) exceeded baseline for this location (2.32 pCi/l). On site KPA for this sample (1.79 pCi/l) was below baseline.

- Sample # GW-2039-B598

Fourth quarter uranium (6.13 pCi/l) was reported above baseline (4.12 pCi/l). On site KPA (4.50 pCi/l) confirmed the above baseline value. Subsequent data will be used to determine whether an increasing uranium trend is apparent at this location.

- Sample # GW-2043-Q398

Total uranium for the third quarter, 1998 (6.04 pCi/l) exceeded baseline (2.43 pCi/l). On site KPA results were 1.73 pCi/l.

Disposal Cell Detection Monitoring

The second semiannual groundwater detection-monitoring event was completed during December 1998. Analytical results from this sampling event will be statistically compared to the baseline data compiled during 1997 and early 1998. The analytical results and statistical analyses of the first and second semiannual RCRA detection monitoring will be reported in the 1998 annual site environmental report.

WELDON SPRING QUARRY

Quarry Water Treatment Plant

- Sample # GW-1035-Q498

The chloride concentration at this monitoring location continued to exceed the baseline value during the fourth quarter 1998. This value (24.0 mg/l) was slightly less than the third quarter sample (31.8 mg/l), but remains above baseline (6.82 mg/l). This location is hydraulically upgradient of the quarry.

- Sample #'s GW-1037-Q398 and GW-1037-Q498

Sulfate baseline (55.5 mg/l) was exceeded during the third quarter (281 mg/l) and fourth quarter (244 mg/l) of 1998. This location is adjacent to the Little Femme Osage Creek. It is suspected that baseline was established during flooding of the creek, which affected groundwater quality, and that the consistent above-baseline values are due to a natural adjustment to conditions when flooding was not occurring.

- Sample #'s GW-1040-Q398 and GW-1040-Q498

Elevated chloride conditions continued to be reported through third (28.4 mg/l) and fourth (31.6 mg/l) quarters of 1998 (baseline is 16.0 mg/l). Chloride is also elevated at the upgradient location for the quarry water treatment plant (see GW-1035-Q498, above).

Quarry Vicinity

No above normal values or indications of any increasing contaminant concentrations were reported for the fourth quarter 1998.

St. Charles County Well Field

One sample from the St. Charles County well field was reported above normal during fourth quarter 1998. Analytical results are discussed below. Uranium activity results from the last four sampling events at the St. Charles County well field are shown on the figure attached to the front of the tables.

- Sample # GW-PW02-Q398

Total uranium for this sample was reported as 6.82 pCi/l. Laboratory error was suspected and the sample was reanalyzed. The result from the reanalysis was reported as less than 1 pCi/l, which is normal for this location

SURFACE WATER

No surface water contaminants (at Level 2 above normal concentrations) were detected in samples collected during the fourth quarter of 1998.

SPRINGS

No elevated contaminants were reported in samples from springs during the fourth quarter of 1998. Total uranium values at Burgermeister Spring are plotted versus time on the figure attached in the front of the tables.

AIR

Data for air monitoring locations are attached. Graphs of the monitoring results are located in front of the tables and are discussed below. There were no above normal air monitoring results for the fourth quarter of 1998.

The gross alpha concentrations for radioactive air particulate monitoring for the fourth quarter 1998 are charted with the background level, which is the most recent 52-week average. Background plus three standard deviations is shown for comparison. The background location is AP-4012, at the Daniel Boone Elementary School in New Melle.

Environmental TLD monitoring results for the third quarter 1998 are charted with the annual background result and the background plus 25 mrem effective dose equivalent (EDE) shown for comparison. The 25 mrem EDE is based on one-fourth of the annual 100 mrem EDE limit for the public established in DOE Order 5400.5. The background locations are TD-4005 (west of the army site) and TD-4009 (Daniel Boone Elementary School, New Melle).

The alpha track radon and thoron monitoring results are graphed for the third quarter of 1998. The background level (based on the most recent four quarters of monitoring) and the Derived Concentration Guide (DCG) for radon and thoron are shown for comparison. DCGs are reference values established for protection of the public and the environment and listed in DOE Order 5400.5.

The background locations are RD-4005 (west of the army site) and RD-4009 (Daniel Boone Elementary School, New Melle).

Summary of Changes to the Radioactive Airborne Particulate Monitoring Program

Beginning with fourth quarter 1998, several enhancements were made (or soon will be made) to the WSSRAP radioactive air particulate-monitoring program. These changes were the culmination of a recently completed study. The basis for the study was air monitoring results in the third quarter that indicated a slight increase in air borne concentrations of radioactive air particulate at offsite monitoring stations. The increases were small and did not exceed normal variations for background however they were viewed as a possible increasing trend warranting further study. As a result of the study, no reasonable explanation of the increases could be ascertained, however it was the consensus of the study team that the increases were not the result of emissions from the site. Also, subsequent air monitoring results indicated that air monitoring results at offsite stations had returned to normal levels and that there was not an increasing trend. Nevertheless, given the commitment to assure that emissions from the site do not cause an increase above normal variations for background at the high school, air monitoring enhancements were approved. The enhancements consist of better statistical tests, additional air monitoring stations (including sector sampling stations), and, gross beta sampling. The following paragraphs provide a more detailed explanation of these enhancements.

Statistical data comparisons between a given station and the background station previously compared 52 weeks of station data to 104 weeks of background data. The new statistical test will now involve comparing 52 weeks of station data to the same 52 weeks of background data. This change is expected to increase the robustness (and thus increase the reliability) of the statistical test.

"Sector samplers" will be placed upwind and downwind of the Weldon Spring Site to identify any above-background radioactive airborne particulate concentrations at the high school attributable to WSSRAP activities. The upwind station, AP-4008-S, will be placed at Station AP-4008 (Army property guardhouse) and the downwind station, AP-4006-S, will be beside the low volume air sampler currently located at the high school. Sector samplers differ from regular low volume samplers in that they are fitted with wind vanes and electronic relay devices that allow them to selectively sample air according to a pre-programmed range of wind directions.

In addition to the gross alpha counting currently done for the low volume air filters, gross beta counting will be added to the filter analysis to provide better trending capabilities for baseline concentrations at the high school. A baseline trend for Station AP-4006 will be established using the weekly gross alpha to gross beta ratio. Gross alpha counting does not distinguish between naturally occurring alpha-emitting radionuclides and long-lived alpha emitters common to the Weldon Spring site. The enhanced methodology will allow for better distinction between varying background levels (due chiefly to the variability associated with airborne concentrations of longer-lived, naturally occurring radon daughters) and concentrations associated with site remediation activities.

A new perimeter station (AP-2013) and a new off-site station (AP-4014) will be placed in line between the WSSRAP disposal facility and the high school. Measurements at these stations, in conjunction with Station AP-4013 (FHHS Annex) results, will be closely watched to evaluate any increasing trends that might affect the high school.

SUMMARY

Analytical results highlighted in the preceding sections of this document were reported as being above prescribed baseline values, varying from historical ranges or being above regulatory limits, and as a result, are subject to more focused attention by the WSSRAP Environmental Protection Group. Continued monitoring is performed to determine the need for additional investigation or action. All other data subject to reporting in the QEDS were within historic range or below reporting criteria unless highlighted in the above discussion.

RD-4009(b)	0.3	N/A
RD-4013	0.3	3
Combined 52-week Background	0.2	N/A

(a) Derived Concentration Guide. Percent of the DCG is determined by subtracting the combined 52-week background average from a station's reported quarterly concentration, dividing by 3 pCi/L (the DCG for radon), and multiplying by 100.

(b) Denotes background monitoring location.

-- Missing detector.
