DOE/OR/22012--T10

STANDARD REPORT FORM

STATIC RENEWAL TESTS USING ANODONTA IMBECILLIS
(FRESHWATER MUSSELS)

Test Title: Anodonta imbecillis QA Test 2, Clinch River - Environmental
Restoration Program (CR-ERP)

Principle Investigator: Damien J. Simbeck

Starting Date: August 24, 1993

Ending Date: September 2, 1993

1.0 EXECUTIVE SUMMARY

Toxicity testing of split whole sediment samples using juvenile freshwater mussels (Anodonta imbecillis) was conducted by TVA to provide a quality assurance mechanism for test organism quality and overall performance of the test being conducted by CR-ERP personnel as part of the CR-ERP biomonitoring study of Clinch River sediments [1]

Testing of sediment samples collected August 14 from Poplar Creek Miles 6.0 and 4.3 was conducted from August 24-September 2, 1993. Results from this test showed no toxicity (survival effects) to fresh-water mussels during a 9-day exposure to the sediments.

2.0 SAMPLE COLLECTION/TREATMENTS

- 2.1 Test Sample Identification (Chemical/Effluent/Elutriate, etc.):
The samples used for biomonitoring were whole sediments collected from Poplar Creek Miles 6.0 and 4.3.
- 2.2 Control and/or Dilution Sediment: Poplar Creek Mile (PCM) 6.0.
- 2.3 Sample Date: August 13, 1993
- 2.4 Sampling Method: Samples were collected by TVA Field Engineering personnel. An Eckman dredge was used to obtain the upper fine sediments (5-10 cm) at each location. Sediment samples from numerous dredge collections were composited in a large container, then split into two samples. One set of samples was sent to TVA's Aquatic Research Laboratory (ARL) at the Browns Ferry Nuclear Plant site near Athens, Alabama, and the other to Oak Ridge National Laboratory (ORNL) for comparative testing.
- 2.5 Sample Transport: All samples were placed in coolers on ice at the time of collection and shipped to ARL by TVA mail.

- 2.6 Sample Storage/Handling: All samples were stored in a refrigerator at $4^{\circ}\text{C} \pm 1^{\circ}\text{C}$ prior to and during the test.
- 2.7 Test Treatments: Three treatments, PCM 6.0 (Control), PCM 4.3-100% and PCM 4.3-50% (diluted with PCM 6.0 sediment), were tested. Filtered 100 μm non-toxic sediment (approximately 800 mg/L dry weight) from the same source used for culture maintenance was also included as a laboratory reference. Moderately hard reconstituted water served as overlying water for all sediment treatments.
- 2.8 Sample Pretreatment: Sediment samples were stirred thoroughly on August 23 with a stainless steel spoon, and sufficient 50 percent sample (V:V) was prepared. Four crystallizing dishes per treatment were set up by adding 25 mL of sediment and 100 mL moderately hard water to each dish. The dishes were placed in the test incubator 24-hr prior to test initiation to allow settling and temperature equilibration.

3.0 TEST ORGANISMS/CULTURING CONDITIONS

- 3.1 Species: Anodonta imbecillis, freshwater mussel
- 3.2 Culture of Test Organisms:
- 3.2.1 Source: In vitro culture, August 9-August 16, 1993, TVA Aquatic Research Laboratory. The gravid adults from which glochidia were extracted were obtained from Taylor's Catfish ponds, Town Creek, Alabama, on June 22 and August 6, 1993. Adults were maintained in a 40-L aquarium with approximately 5 L non-toxic sediment from Taylor's ponds and 20 L Tennessee River water. Water was renewed at least once per week with bloomed phytoplankton water and sediment was renewed monthly.
- 3.2.2 Culture medium: Mussel culture medium used to transform larvae (glochidia) into juveniles consisted of a 2:1 mixture of cell culture medium (MEM) and 0.22 μm filtered catfish plasma. Antibiotics and antimycotics were added in small concentrations to prevent bacterial and fungal contamination. [3]
- 3.2.3 Temperature of culture: $24^{\circ}\text{C} \pm 1^{\circ}\text{C}$
- 3.3 Maintenance of Test Organisms:
- 3.3.1 Culture water: After transformation of larval mussels, the free-living juveniles were placed in 100 μm filtered TR water with bloomed indigenous algae (phytoplankton). Non-toxic sediment (100 μm filtered) was added to provide additional food and substrate for healthy growth of the juvenile mussels. [4]
- 3.3.2 Temperature of culture: $24^{\circ}\text{C} \pm 1^{\circ}\text{C}$

- 3.3.3 General maintenance: Cultures were maintained in 1000-mL Nalgene® trays in 24-h dark incubators. From August 16-22, cultures were changed out daily with fresh phytoplankton water and silt. Cultures were fed a concentrated Selenastrum/desmids mixture (10 mL/L) daily through August 19 and concentrated phytoplankton (10 mL/L) daily thereafter. Health and survival of the culture were checked by microscopic examination of animals when culture water was changed.

One day prior to test initiation (August 23) mussels were counted and transferred into test cylinders which were placed in crystallizing dishes containing moderately hard water spiked with reference sediment and YCT-S.

3.4 Food Preparation:

- 3.4.1 Phytoplankton preparation: Phytoplankton was bloomed in 20-L glass aquaria 4-7 days (until dark green). Blooms were initiated by adding concentrated solids from ARL channel water to filtered (100 µm) TR water. Algal nutrients used for Selenastrum cultures were added (1 mL/L) to boost algal blooms. [5] Blooms were centrifuged to concentrate the algal cells into a dark green suspension, obtaining about 0.5 L per aquarium. Prepared phytoplankton concentrate was refrigerated until used.

- 3.4.2 YCT and Selenastrum preparation: YCT is made according to methods modified from EPA/600/4-89/001 with tropical fish food substituted for trout chow and alfalfa substituted for Cerophyll. [6] The alga Selenastrum capricornutum concentrated to 30×10^6 cells/mL is also fed as part of the test diet.

- 3.5 Sediment Preparation: Whole, non-toxic sediment from Taylor's Catfish ponds, Town Creek, Alabama, was filtered through a 100-µm nylon mesh filter. Filtered sediment was stored at 4°C until used.

4.0 TEST METHODS

- 4.1 Mussels, Anodonta imbecillis, Survival Test, TVA Test Method, SOP-22, solid phase protocol. [5]
- 4.2 Modification/Deviations to SOP-22:
- 4.2.1 Mussels were fed 3 mL/L YCT and 3mL/L Selenastrum daily instead of concentrated phytoplankton.
- 4.2.2 Test sediment was placed into dishes 24 hr before use and placed in the incubator to allow settling and temperature equilibration. This sediment was not renewed during the 9-day test period.

- 4.2.3 Due to lack of concentrated phytoplankton, the juvenile cultures were changed out daily with fresh phytoplankton water, and fed approximately 10 mL of a Selenastrum/Desmid mixture through Culture Day 3. (See Section 3.3.3)
- 4.3 Date/Time Test Initiated: August 24, 1993/0800 CDT
- 4.4 Date/Time Test Terminated: September 2, 1993/0810 CDT
- 4.5 Age of Test Organisms: 8 days old
- 4.6 Test Chamber: 50 mm-diameter glass cylinder (75 mm tall) with 100- μ m nylon mesh bottom, placed in 250-mL crystallizing dish
- 4.7 Volume per Chamber: 100 mL water, 25 mL sediment
- 4.8 Number of Organisms Per Replicate: 10
- 4.9 Number of Replicates Per Treatment: 4
- 4.10 Dilution Sediment: PCM 6.0
- 4.11 Test Control: PCM 6.0
- 4.12 Overlying Water: Moderately hard synthetic water
- 4.13 Test Temperature: 24°C $\pm$ 1
- 4.14 Photoperiod: 24-h dark
- 4.15 Renewal Period: 24-h
- 4.16 Renewal Method: Following removal of 60 mL of the overlying water for chemical analyses, each test cylinder was placed in a petri dish with moderately hard reconstituted water for microscopic examination. After examination, the cylinder was returned to the same crystallizing dish, and 60 mL fresh water was poured into the test vessel through the test cylinder. Test sediment was not renewed during this test.
- Taylor's reference sediment was renewed daily by adding approximately 840 mg dry weight filtered sediment (3.5 mL) per liter of moderately hard water. Dishes were emptied and renewed with 150 mL water/sediment mixture.
- 4.17 Feeding Regime During Test: Following renewal, 0.45 mL each of YCT and Selenastrum were added to each test chamber.
- 4.18 Physical and Chemical Parameters Measured: Parameters measured daily ("initial") on overlying and reference waters (following addition of silt and algae) were temperature (temperature adjusted to equal "final" temperature before renewal), DO, pH, conductivity, alkalinity and hardness.

"Final" measurements of temperature were taken in one replicate per treatment before renewal. "Final" measurements of DO, pH, conductivity, alkalinity, hardness and total ammonia were measured in a combination of overlying waters (60 mL/replicate/day) from all replicates per treatment following renewal. The test solutions (50 mL) were preserved with 1:4 H₂SO₄ and refrigerated until sent to TVA's Environmental Chemistry Laboratory in Chattanooga, Tennessee, for ammonia analysis using the automated alkaline phenate methodology.

4.19 Test Endpoint Determination:

4.19.1 Survival: Test animals were counted as dead when microscopic examination revealed valves gaped open and no observable internal movement or an empty shell.

4.20 Statistics: Revised statistical procedures contained in the fourth edition of EPA's acute toxicity methods require a decision process for testing statistical assumptions before selecting a specific statistical test to determine toxicity endpoints. [7] The decision process followed for testing survival effects is shown in Section 6-2-1. Statistical significance of results was determined following procedures for comparing single treatments versus control. Based on tests for normally distributed data and homogeneous variances, the statistical test used for endpoint determination was the T-Test.

5.0 QUALITY ASSURANCE

5.1 Toxicity Test Methods: All phases of the study including, but not limited to, sample collection, handling and storage; glassware preparation; test organism culturing/acquisition and acclimation; test organism handling during test; and maintaining appropriate test conditions were conducted according to the protocol as described in this report, the ARL Quality Assurance Plan and SOP Manual, and EPA/600/4-89/001. [5][7] Any known deviations were noted during the study and are reported herein.

5.2 Physical and Chemical Methods

5.2.1 Reagents, Titrants, Buffers, etc.: All chemicals were certified products used before expiration dates (where applicable). All ARL chemicals are recorded in a bound Laboratory Chemical Logbook and specific chemicals used were documented on a chemical record sheet contained in the study notebook.

- 5.2.2 Instruments: All identification, service, and calibration information pertaining to ARL laboratory instruments is contained in bound Laboratory Instrument Logbooks and specific instruments used were documented on an instrument record sheet, along with daily calibration record sheets, contained in the study notebook.
- 5.2.3 Temperature was measured using mercury thermometers. The instrument was standardized and inspected with readings made according to TVA procedure DS-42.11. [2]
- 5.2.4 Dissolved oxygen was measured using a YSI Model 57 oxygen meter. The instrument was standardized (using the Winkler method) and readings were taken according to TVA procedures DS-43.6 and DS-42.4, respectively. [2]
- 5.2.5 The pH was measured using an Orion Model SA250 meter equipped with an Orion Ross combination electrode. The instrument was standardized and readings were made according to TVA procedures DS-43.7 and DS-42.8, respectively. [2]
- 5.2.6 Conductance was measured using a YSI Model 32 SCT meter. The instrument was standardized and readings were taken according to TVA procedures DS-43.3 and DS-42.3, respectively. [2]
- 5.2.7 Alkalinity was measured by titration of 100 mL samples with 0.02 N H_2SO_4 to an end point of 4.5 according to TVA procedure DS-42.1. [2]
- 5.2.8 Hardness was determined by titration of 50 mL samples with EDTA to a colorimetric endpoint using an indicator (Instructions provided by Reagent Manufacturer [Calgon]), Schwarzenbach Method.
- 5.2.9 Total residual chlorine was determined using the DPD Titrimetric Method according to TVA procedure DS-42.9, Rev. 0. [2]

6.0 RESULTS

- 6.1 Summary of Results: Nine day exposure of juvenile freshwater mussels, Anodonta imbecillis, to whole sediments from Poplar Creek showed no toxicity at PCM 6.0 (100 percent) or PCM 4.3 (100 percent and 50 percent).

6.2 Results, Survival Data:

6.2.1 Statistical Decision Process for Determining Toxicity Endpoints for 9-day Exposure of the Juvenile Mussel, Anodonta imbecillis, to Test Sediments, August 24-September 2, 1993.

DETERMINATION OF PASS OR FAIL FROM A
SINGLE-TREATMENT-CONCENTRATION ACUTE TOXICITY TEST

6.2.2 Daily Percent Survival Summary for Anodonta imbecillis, Whole Sediment QA Test 2, CR-ERP, August 24-September 2, 1993.

Treatment	Total Daily % Survival								
	1	2	3	4	5	6	7	8	9
PCM 6.0	100	100	98	98	98	98	95	95	95

- 6.3 Water Chemistry Summary for Anodonta imbecillis, Whole Sediment QA Test 2, CR-ERP, August 24-September 2, 1993.
- 6.3.1 Test Temperature: 24.2°C (23.1°-24.9°C)
- 6.3.2 See: Appendix A Water Chemistry Mean Values and Ranges for Anodonta imbecillis, Whole Sediment QA Test 2, CR-ERP, August 24-September 2, 1993.

7.0 CONCLUSION

Testing of sediment samples collected August 13 from Poplar Creek Miles 6.0 and 4.3 was conducted from August 24- September 2, 1993. Results from this test showed no toxicity (survival effects) to fresh-water mussels during a 9-day exposure to the sediments.
