ABSTRACT

The Environmental Regulatory Update Table provides information on regulatory initiatives impacting environmental, health, and safety management responsibilities. The table is updated bi-monthly with information from the Federal Register and other sources, including direct contact with regulatory agencies. Each table entry provides a chronological record of the rulemaking process for that initiative with an abstract and a projection of further action.

Regulatory Highlights - January/February, 1995

1. Criteria for the Certification and Determination of the Waste Isolation Pilot Plant's Compliance with Environmental Standards for the Management and Disposal of Spent Nuclear Fuel, High Level-and Transuranic Radioactive Wastes - Proposed Rule

EPA proposes criteria and procedures for certifying and determining whether DOE's Waste Isolation Pilot Plant (WIPP) complies with 40 CFR 191, Environmental Standards for the Management and Disposal of Spent Nuclear Fuel, High Level-and Transuranic Radioactive Wastes. The proposed rule specifies the required content of applications for certifying and determining compliance with 40 CFR 191 including detailed information and documentation of models used to demonstrate compliance, detailed description of the characteristics of the waste, descriptions of active and passive institutional controls, discussion of the process used for the elicitation of any expert judgement used in demonstrating compliance, and documentation of quality assurance. Peer review is required for all information contained in any application. EPA would limit the scope of performance-assessments by only requiring consideration of events or sequences of events which have a chance of greater than one in 10,000 of occurring over 10,000 years. The proposal eliminates the difficulty of predicting the environmental conditions and habits of future populations by specifying that such conditions and habits should be assumed to remain constant based on characteristics as they are today. In a effort to better understand the effect of the different wastes streams, EPA proposes that DOE undertake a study to determine the effect of the various waste characteristics on the disposal system. An additional DOE study is proposed to evaluate the benefits and costs of engineered barrier alternatives. Criteria are proposed for complying with the monitoring requirements of 40 CFR 191 for both pre-closure and post-closure monitoring. In addition, the proposed rule sets out the notification requirements and response actions necessary for DOE in the event, during waste emplacement, the conditions at the WIPP depart from the conditions and assumptions used to form the basis of the application. The comment period for the proposed rule ends May 1, 1995.

2. Protection of Stratospheric Ozone: Supplemental Rule to Amend Leak Repair Provisions under Section 608 of the Clean Air Act - Proposed Rule

EPA proposes to amend the leak repair provisions of the refrigerant recycling regulations under the CAA to reflect the limitations of industrial process refrigeration systems. The proposal also addresses federally owned or operated commercial or comfort cooling systems where procurement requirements prevent the timely acquisition of parts and services in order to meet the current 30-day time period. For federally owned or operated commercial or comfort cooling systems, the only additional time allowed for procurement would be the time required to receive delivery of the necessary parts. Other delays for repairs at federal facilities would require the facility to follow an exemption by request method similar to that proposed for industrial process refrigeration systems. The revisions

would allow additional time to repair industrial process refrigeration systems due to the complexities involved in detecting leaks, repairs that require the system to be shutdown, parts which are not readily available, additional time necessary to obtain the proper permits and/or comply with federal and state requirements, and other scenarios unique to these systems. When repairs cannot be made within the 30-day period, owners and operators of such systems would be required to submit to EPA a one-year retrofit, replacement, or retirement plan for the leaking equipment. In certain listed situations, such as time required to obtain the necessary parts, additional time past the one-year time frame will be available to those facilities retrofitting or replacing a system. In addition, the proposed rule addresses the determination of a full charge for an industrial process refrigeration system, treatment of purged refrigerant, clarification of the leak rate, and temporary shut down of systems prior to repairing leaks. The comment period for the proposed rule ended February 21, 1995.

3. Effluent Limitations Guidelines, Pretreatment Standards, and New Source Performance Standards: Centralized Waste Treatment Category - Proposed Rule

Under the Clean Water Act (CWA), EPA proposes to establish effluent limitations and pretreatment standards for the discharge of pollutants into navigable waters of the United States and into publicly-owned treatment works by existing and new facilities defined as "centralized waste treatment facilities." These are facilities that treat any hazardous or non-hazardous industrial wastes received from off-site facilities by tanker truck, trailer/roll-off bins, drums, barges, or other forms of shipment. A centralized waste treatment facility includes (1) a facility that treats only wastes received from off-site and (2) a facility that treats waste generated on-site as well as waste received from off-site. The proposed regulation would apply to the following types of activities at centralized waste treatment facilities: (1) discharges from operations which treat, or treat and recover metals from, metal-bearing waste received from off-site; (2) discharges from operations which treat, or treat and recover oil from, oil waste received from off-site; and (3) discharges from operations which treat, or treat and recover organics from, other organic-bearing waste received from off-site. Discharges resulting from the treatment of wastes received from off-site through an open or enclosed conduit (e.g., pipeline, channel, ditch) would not be regulated by the proposal. (This exclusion would not apply to discharges resulting from the treatment of waste received via conduit from facilities that are merely waste collection centers and not the original source of the waste.) For existing facilities, EPA is proposing effluent limitations based on the best practicable control technology currently available (BPT), the best conventional pollutant control technology (BCT), and the best available technology economically achievable (BAT). For new facilities, discharges would be regulated by new source performance standards (NSPS) equivalent to the proposed BPT/BCT/BAT limitations. For facilities discharging to publicly-owned treatment works, EPA is proposing pretreatment standards equivalent to the proposed BAT for existing sources and pretreatment standards equivalent to the NSPS for new sources. Comments on the proposal will be accepted until April 27, 1995.
