EXECUTIVE SUMMARY

This Statement of Basis/Proposed Plan is being issued by the U.S. Department of Energy (DOE), which functions as the lead agency for the Savannah River Site (SRS) remedial activities, with concurrence by the U.S. Environmental Protection Agency, and the South Carolina Department of Health and Environmental Control (SCDHEC).

The purpose of this Statement of Basis/Proposed Plan is to describe the **preferred** alternative for addressing the Grace Road Site (GRS) located at the SRS, in Aiken, South Carolina and to provide an opportunity for public input into the remedial action selection process. R.61-79.124 of the South Carolina Hazardous Waste Management Regulations (SCHWMR) and Section 117(a) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended, require advertisement of a draft RCRA permit modification and notice of proposed remedial actions (i.e., the Statement of **Basis/Proposed Plan**).

The results of the Resource Conservation and Recovery Act (RCRA) Facility Investigation / Comprehensive Environmental Response Compensation and Liability Act (CERCLA) Remedial Investigation (MI/RI), indicate that there is no impact to human health or the environment **from** the Grace Road Site. Therefore, the DOE, EPA - Region IV, and SCDHEC are proposing that no action is needed at the unit. No other alternatives were **considered**. This is a proposed final action **for** the Grace Road Site.

The Grace Road Site is located **1.3 kilometers (0.8 miles)** south of B-Area and east of the intersection of Grace Road with SRS Road 2. The unit is roughly rectangular in shape and has a northwest-southeast orientation. Approximate dimensions of the unit are 396.3 meters (1,300 feet) by 97.6 meters (320 **feet**) and it covers an area of about 3.8 hectares (9.6 acres). Waste at the unit consisted of drums and cans in a variety of sizes ranging **from** less than 1 gallon to 55 gallon drums, car seat springs, car and truck parts, old foundations, bricks, shingles, and slabs of concrete. The Grace Road area was originally a tenant-operated farm which later seined as the laydown yard for the construction of **B-Area**.

AU the debris, drums and **concrete** slabs were removed from the area in 1992. The **area** was then graded and **seeded**.

No documentation was found indicating that the GRS was ever used for hazardous or non-hazardous waste disposal activities. There is no evidence of any recent disposal activity nor that the disposal activity was more **widespread**.

The only contaminant of potential concern (COPC) identified in the risk assessment that **exceeded** a risk of 1×10^{-6} was arsenic and it is less than 3.8×10^{-5} , which is within the EPA target risk range of one in ten thousand (10^{-4}) to one in one million (10^{-6}). Arsenic detected in the unit specific samples had a maximum concentration of 3.2 **mg/kg**. It should also be noted that arsenic was a component of agricultural chemicals in the period before SRS existed. Since the Grace Road area was a farm prior to SRS, it is likely that the detected values may be a result of **pre-1950** farming activities. SRS **unimpacted** area values for arsenic range from less than 0.5 **mg/kg** to 15.2 **mg/kg**.

Since the arsenic detected is not from the **unit**, the **source** of the arsenic will be evaluated on a site-wide scale during the Soil Background Study (or possibly as part of a Site-wide Soil Integrator Operable Unit).

Based on the investigation performed at the Grace Road Site, it is recommended that no remedial **action** be performed at this **unit**.

Community involvement in the remedial action selection process for the GRS is strongly encouraged. All submitted comments will be reviewed and considered. A Responsiveness Summary to address **significant** issues raised during the public comment period will be **made available in the final RCRA** permit modification and the Record of Decision (ROD). The **final** remedial decision **for** the unit will be documented in the final RCRA permit modification decision and the **Record** of Decision.

SECTION I: INTRODUCTION AND BACKGROUND

Introduction

This Statement of Basis/Proposed Plan is issued by the U.S. Department of Energy, which functions as the lead agency for SRS remedial activities, and with concurrence by the **EPA**, and the **SCDHEC**. The purpose of this Statement of Basis/Proposed Plan is to describe the preferred alternative for addressing the Grace Road Site (Bldg. # 631-22G) located at SRS, in **Aiken**, South Carolina.

The results of the Resource Conservation and Recovery Act (**RCRA**) Facility Investigation/Comprehensive Environmental Response Compensation and Liability Act (**CERCLA**) Remedial Investigation (**RFI/RI**), indicate that the **GRS** poses no risk to human health or the **environment**. Therefore, the DOE, EPA - Region IV, and **SCDHEC** are proposing that no action is needed at the **unit**. No other remedial alternatives were considered. This is a proposed final action for the waste **unit**.

SRS manages certain waste materials which are regulated under **RCRA**, a comprehensive law, requiring responsible management of hazardous waste. **RCRA** 3004(u) requires that releases from solid waste management units be investigated and **remediated** as necessary. The Grace Road Site is a solid waste management unit regulated under **RCRA** 3004(u).

SRS has a **RCRA** hazardous waste permit from **SCDHEC** that mandates that SRS establish and implement an **RFI** Program to fulfill the requirements specified in **RCRA** Section 3004(u). On December 21, 1989, SRS was included on the National Priorities List (**NPL**). This inclusion created a need to integrate the established **RFI** Program with **CERCLA** requirements to provide for a focused environmental program. In accordance with Section 120 of **CERCLA**, DOE has negotiated a Federal Facility Agreement (**FFA**, 1993) with EPA - Region IV and **SCDHEC** to coordinate remedial activities at SRS into one comprehensive strategy which fulfills these dual **regulatory** requirements.

Both **RCRA** and **CERCLA** require that the public be given the opportunity to review and comment on the draft **permit** modification and the proposed remedial alternative. Public participation requirements are listed in **SCHWMR R.61-79.124** and Sections 113 and 117 of **CERCLA**. These requirements include the establishment of an Administrative Record **File** that documents the selection of remedial alternatives and allows for review and comment by the public

regarding those alternatives. The Administrative Record File must be established "at or near the facility of issue." The SRS Public Involvement Plan (DOE, 1994) is designed to facilitate public involvement in the decision-making process for permitting, closure, and the selection of remedial alternatives. **SCHWMR R.61-79.124** and Section 117(a) of **CERCLA**, 1980, as amended, require advertisement of the draft permit **modification** and proposed remedial action and provide the public an opportunity to participate in the selection of the **remedial** action.

This Statement of Basis/Proposed Plan is a summary of the Administrative Record File leading to the selection of the preferred alternative. The Statement of Basis/Proposed Plan presents the preferred alternative and the rationale for selecting the alternative. Public participation in considering this proposed action is strongly encouraged.

SCHWMR R.61-79.124 requires that a brief description and response to all **significant** comments be made available to the public as part of the **RCRA** Administrative Record. Following the public comment period, a Responsiveness Summary will be prepared to address significant issues raised during the public comment period. The Responsiveness Summary will be made available with the final **RCRA** permit modification and in the **ROD**. All submitted comments will be reviewed and considered.

Following the public comment period and after all comments have been reviewed and considered, DOE, in consultation with EPA - Region IV and **SCDHEC**, will select the final remedial action, that will **satisfy** the **FFA** requirements. The final selection of the remedial alternative under **RCRA** will be in the form of a final permit **modification** decision which will be made by **SCDHEC**. It is important to note that the **final** action may differ from the preferred alternative discussed in this plan, depending upon the public participation. The final alternative chosen will be protective of human health and the environment and comply with all Federal and State environmental laws.

In order to gain a better understanding of **CERCLA** activities as they pertain to the **unit**, the public is encouraged to review the Administrative Record File for this **unit**. Refer to Section II of this document for information regarding availability and access to the Administrative Record File.

Background

SRS occupies approximately 310 square miles of land adjacent to the Savannah River, principally in **Aiken**

and **Barnwell** Counties of South Carolina (Figure 1). SRS is a secured U.S. government facility with no permanent residents. The Site is located approximately 25 miles southeast of Augusta, Georgia, and 20 miles south of **Aiken**, South Carolina.

SRS is owned by DOE. Management and operating services are provided by Westinghouse Savannah River Company (**WSRC**). SRS has historically produced **tritium**, plutonium, and other special nuclear materials for national defense. SRS has also provided nuclear materials for the space program and for medical, **industrial**, and **research efforts**.

The FFA lists the Grace Road Site (Bldg. #63 **1-22G**) as a **RCRA/CERCLA** unit requiring further evaluation **to determine** the actual or potential impact to human health and the environment.

SECTION II: COMMUNITY INVOLVEMENT

This document summarizes information that is provided in greater detail in the **Administrative Record** File, which is available for review by the public at the following locations:

U.S. Department of Energy
Public Reading Room
Gregg-Graniteville Library
University of South **Carolina-Aiken**
171 University **Parkway**
Aiken, South Carolina 29801
(803) 641-3465

Thomas Cooper Library
Government Documents **Department**
University of South Carolina
Columbia, **South Carolina** 29208
(803) 777-4866

Similar information is available through the **repositories** listed below:

Reese Library
Augusta State University
2500 Walton Way
Augusta, Georgia 30910
(706) 737-1744
Asa H. Gordon Library
Savannah State University
Tompkins Road
Savannah, Georgia 31404
(912) 356-2183

The **RCRA Administrative** Record File for SCDHEC is available for review, by the public, at the following locations:

The South Carolina Department of Health and Environmental Control
Bureau of Solid and Hazardous Waste Management
8901 **Farrow** Road
Columbia, SC 29203
(803) **896-4000**

Lower Savannah District
Environmental Quality Control Office
215 **Beaufort St.**, N. E.
Aiken, South Carolina 29802
(803) 648-9561

The public will be **notified** of a public comment period through mailing of the **SRS Environmental Bulletin**, a newsletter sent to approximately 3500 citizens in South Carolina and **Georgia**, and through notices in the **Aiken Standard**, the **Allendale Citizen Leader**, the **Barnwell People-Sentinel**, **The State**, and the **Augusta Chronicle newspapers**. The public comment period will also be announced **on local radio** stations.

DOE will provide the opportunity for a public meeting during the public comment period if significant interest is expressed. The public will be notified of the date, time, and location. At the meeting, the proposed action will be discussed and questions about the action will be answered. Written and oral comments will be accepted and considered prior **to a final** decision.

To request a public meeting during the comment **period**, submit written comments about this proposed action, or to obtain more information concerning this Statement of **Basis/Proposed** Plan, contact one of the following

DOE, EPA-Region IV, and SCDHEC strongly encourage community participation in the remedial action selection process for the GRS. A Responsiveness Summary to address issues raised by the public will be made available following the public comment period, if any comments are received, and with the Record of Decision and RCRA permit.

Following the public comment period and a review and consideration of all submitted comments, ROD will be signed and a final decision for the RCRA permit will be issued. The alternative chosen must be protective of human health and the environment and comply with all Federal and state environmental laws.

SECTION III: SCOPE AND ROLE OF OPERABLE UNIT OR RESPONSE ACTION WITHIN THE SITE STRATEGY

The overall strategy for addressing the Grace Road Site operable unit was to: 1) determine if there had been a release of hazardous substances; 2) determine the nature and extent of any contamination; 3) perform a baseline risk assessment; and 4) evaluate the need for remedial action to address any potential risk to human health and the environment.

The investigation and risk assessment have been completed for the GRS. Since the results of the investigation indicate that there is no impact to human health or the environment, no action is being recommended by this proposed plan. Arsenic was the only substance identified as a contaminant of potential concern by the risk assessment. The values detected were above unit specific background levels. However, the arsenic did not appear to be from the Grace Road Site. It is possible that the arsenic is from farming activities prior to SRS being built.

The GRS is part of the larger Upper Three Runs watershed consisting of several surface and groundwater units. It has been determined that GRS does not contribute contamination to the area groundwater within the watershed. The source of the arsenic will be evaluated on a Site-wide scale during the implementation of the Soil Background Study (or possibly in a Site-wide Soil Integrator Operable Unit Work Plan). The proposed action for GRS is a final action.

SECTION IV: MEDIA SPECIFIC OPERABLE UNIT - GRACE ROAD SITE

Section IV.A Unit Description, History, and Media to be Addressed

Unit Description and Location -

GRS is located approximately 1.3 kilometers (0.8 mi) south of B-Area and about 244 meters (800 yards) east of the intersection of Grace Road and SRS Road 2. The unit is roughly rectangular in shape and has a northwest-southeast orientation running parallel to Grace Road. The unit is approximately 396.3 meters (1300 ft) by 97.6 meters (320 ft). It covers an area of about 3.8 hectares (9.6 acres), see Figure 2.

Prior to the establishment of SRS, Grace Road Site was part of a tenant-operated farm owned by Mrs. Elise Grace. The farm consisted of about 217.6 hectares (544 acres) of which 92 hectares (230 acres) were under cultivation, and the remaining 125.6 hectares (314 acres) were in woodlands and swamp lands. Transfer records of this land to the U. S. Government in January 1951 indicate that this land had been a farm (part of the Red Hill Plantation) since the late 1890's.

Buildings on the farm consisted of a main house, dog kennel, machine shed, oil house, two cottages, two turkey houses, two barns, garage, cook house, two-story barn, water tower with meat house, storage shed, grain storehouse, hay storage barn and an outhouse (privy). The majority of the buildings had a foundation of bricks, concrete or tile blocks. Several buildings, including the dog kennels and turkey houses, had concrete slab floors. The water tower also had massive concrete blocks that were used to hold treated timber stanchions that supported the water tank. Photographs of the farm show at least two gasoline powered tractors in the machine shed, a truck and other assorted farm machinery.

After purchase by the Government, the area in and around the farm was utilized as a laydown yard for materials used in the construction of the B-Area. The length of time that it was utilized for this purpose is unknown, but is estimated to be two to three years. There are no records to indicate that this unit has been used for any other purpose since it was closed as a laydown yard in the mid-1950s.

The Grace Road Site consisted of numerous concrete slabs, brick foundations (pre-SRS) and miscellaneous debris. Small mounds of concrete, bricks, shingles, car and truck parts and large concrete blocks that appear to be pieces of a bridge were placed at the unit. The unit also contains numerous drums and cans varying in size

from 1/2 gallon cans to 55 gallon drums and various car parts. A few of the smaller cans and drums are labeled oil and grease. Most of the debris was on the surface or partially buried in scattered locations across the unit.

The nearest surface water is the Upper Three Runs Creek which is approximately 2.4 km (1.5 mi) east of the unit and an unnamed branch 1.6 km (1 mi) to the west. Most of the unit is covered in tall grasses and weeds with some scattered trees and low shrubs.

Numerous wells are located in the vicinity of Grace Road. None of the wells are specifically in place to monitor the Grace Road Site. One well cluster is located about 30 feet northeast of the unit and another is 40 feet southeast of the unit. Water table elevations in these wells indicate that the water table is above 200 feet mean sea level or approximately 80 feet below ground surface. The unit appears to be in the middle of a recharge zone and groundwater flows south and east from it.

The upper soil layers at the unit consist mainly of fine to medium grained sands mixed with small amounts of silt and clay containing traces of lignite. Clay content in the soils increases with depth. From a depth of approximately 10 feet downward to the lowest sampling depth of 20 feet, the sediment is a hard compact red clay.

All the drums, cans and jars located at the unit were free of any hazardous waste material

Soil sample locations were chosen near the areas where the drums and cans were concentrated. This was done to determine the extent of any contamination released to the soils from the drums.

No records of any type of waste management activity have been found for the Grace Road Site. Based upon available information, i.e., literature search and records search, no hazardous materials have been managed or disposed of at Grace Road. In 1992, all debris at the GRS was removed from the area and either sent to the sanitary landfill or used for erosion control (concrete bids).

History of Unit / Conceptual Release Model

There is no documented information available regarding past hazardous or non-hazardous waste disposal activities at GRS. Markings on the drums found at the unit suggest that they once contained oil and grease. There is no evidence that any recent disposal activity has occurred or that the disposal activity was more widespread. Also, there is no evidence of any burning or excavation at this waste unit.

Between February and May 1992, all the debris, drums and concrete slabs were removed from the Grace Road Site. The items removed were either used at soil erosion control areas or disposed of in the sanitary landfill. The EPA and SCDHEC granted approval prior to SRS removing the materials from the waste unit.

Only surface disposal activities appear to have occurred at the GRS. Based on this, the conceptual release model consisted of a release to surface soils with a potential for leaching to subsurface soils, and only surface and subsurface soils were investigated. For a detailed explanation of the release model, potential receptors and the fate and transport of contamination, see the RFI/RI report for the Grace Road Site (631-22G), WSRC-RP-95-93 (WSRC, 1996).

Media Assessment

Soil/vadose zone and groundwater investigations were conducted between 1990 and 1994. The initial investigation was based on a 1988 soil gas survey which detected low levels of hydrocarbons and chlorinated hydrocarbons. Detailed descriptions of the investigation and characterization conducted at the Grace Road Site may be found in the RCRA Facility Investigation/Remedial Investigation Report for the Grace Road Site (631-22G), WSRC-RP-95-93 (WSRC, 1996) and the RCRA Facility Investigation/Remedial Investigation Plan for the Grace Road Site, WSRC-RP-.501250 (WSRC, 1990).

Groundwater

Groundwater samples from wells near the Grace Road Site indicate that there is no groundwater contamination.

Surface Water/Sediment

No surface water or sediment sampling was conducted because the nearest surface water feature is located over 1 mile from the GRS.

Soils

The soils investigation was designed to assess the horizontal extent and vertical migration of any hazardous constituents at the unit and to evaluate (prove/disprove) the release model.

The soils investigation included taking soil samples (1990 and 1994), an electromagnetic survey (1990), a ground penetrating radar (GPR) survey (1994) and a soil gas survey (1994).

The magnetometer survey and the GPR survey indicated that there are no buried materials at the unit.

An extensive soil gas survey was performed in 1994. A total of 85 sample locations were established and samples collected at each location. Species monitored for this survey were: light hydrocarbons (C₁-C₄); gasoline range normal paraffins (C₅-C₁₀); gasoline range aromatic hydrocarbons, (BTEX); diesel range hydrocarbons (C₁₁-C₁₇); selected organics; and mercury.

The levels of volatiles and diesel range organics observed in the survey were very low with most below minimum detection levels. Levels of light hydrocarbons and mercury were indicative of background concentration in the SRS area. No evidence of contamination was detected at this unit by the soil gas survey.

Confirmation soil sampling served as a screening for semi-volatile and volatile organic compounds, metals, and radionuclides. In addition, Appendix IX parameters were also analyzed. Results from the soil gas survey conducted in 1988 and the location of the debris/rubble were used to select soil sample locations. Background samples were also obtained for comparison purposes.

Metals found in concentrations greater than analytical method detection limits were arsenic, barium, cadmium, chromium, mercury, lead, selenium, tin, vanadium and zinc. Acetone, methylene chloride and bis(2-ethylhexyl)phthalate were also detected. Phthalate species are used as plasticizers for cellulose, glass, plastic, and rubber products. Other substances detected, such as acetone, xylene, and methylene chloride are commonly used as laboratory solvents. Radionuclide indicator parameters (gross alpha, non-volatile beta) were within background. See Table 1 for constituent concentrations and background levels.

The concentration levels of the analytes, with the exception of arsenic and lead, were within background levels and were insignificant in terms of having an effect on human health and the environment. The concentration levels detected at the unit for arsenic ranged from 2.6 to 3.2 mg/kg and for lead ranged from 0.9 to 48.1 mg/kg.

Section IV.B Operable Unit Risks

Human Health Risks

As part of the RCRA/CERCLA process for the Grace Road Site, a risk assessment was performed using the data generated during the assessment phase. Detailed information regarding the development of COPCs, the fate and transport of contaminants and the risk

assessment can be found in the RFI/RI Report for Grace Road Site (631 -22 G), WSRC-RP-95-93 (WSRC, 1996).

After combining analytical data and eliminating those analytes not detected in any samples, the data were evaluated on the basis of quality with respect to sample quantitation limits, frequency of detection, relative toxic potential of the constituent, laboratory qualifiers and codes, and blanks. The remaining data (constituents detected) were compared to 2 times the unit specific background and EPA developed Risk Based Concentrations (RBCs).

RBCs developed by EPA Region III (EPA, 1995) were used to screen the chemicals of potential concern for the Grace Road Site. This guidance provides reference doses and carcinogenic potency data for nearly 600 chemicals. These toxicity constants have been combined with "standard" exposure scenarios to calculate RBCs - chemical concentrations corresponding to fixed levels of *(i. e., a hazard quotient of 1, or a lifetime cancer risk of one in one million. The RBCs are very similar to preliminary remediation goals which are concentration goals for individual chemicals for a specific medium and land use combinations at CERCLA units.

As a result of comparing the unit sample concentrations to 2 times the background concentrations and EPA-III RBC values (Table 1), only two chemicals remain to be studied further, arsenic and lead.

The screening level for lead in soil is 400 mg/kg for residential land use. This value is described in OSWER Directive 9355.4-12, Revised Internal Soil Lead Guidance for CERCLA Sites and RCRA Corrective Action Facilities, dated July 14, 1994 and issued by the USEPA (EPA, 1994). Because the lead concentrations ranged from 0.9 to 48.1 mg/kg, which were far below the EPA guidance level, lead was eliminated as a COPC.

Since arsenic was not eliminated from the screening process, calculations were performed to determine the risk for the on-unit resident scenario. Note however, that arsenic was used as a component of agricultural chemicals in the period before SRS existed and that Grace Road was a farm. Thus, a few of the detected values may be a result of farming activities prior to 1950. SRS site wide values for arsenic range from less than 0.5 mg/kg to 15.2 mg/kg. The SRS maximum concentration level for arsenic in Blanton (the soils type found at Grace Road) soils is 7.05 mg/kg.

A complete exposure pathway consists of the following four elements: (1) a source and mechanism of contaminant release to the environment, (2) an environmental transport medium for the released

contaminants, (3) a point of contact with the contaminated medium, and (4) a route of entry of the contaminant into the receptor at the exposure point. If any of these elements were missing, the pathway was incomplete and was not considered in the baseline risk assessment (BRA) for Grace Road. Only one land use scenario was considered future land use (residential). The potential human receptor addressed was a hypothetical future on-unit resident. A current on-unit worker scenario was not performed because no worker activity is conducted in the area.

Cancer risks are estimated as the incremental probability of an individual developing cancer over a lifetime as a result of pathway-specific exposure to carcinogenic contaminants. The risk to an individual resulting from exposure to non-radioactive chemical carcinogens is expressed as the increased probability of a cancer occurring over the course of a 70 year lifetime. Cancer risks are related to the EPA target range of one in ten thousand (1×10^{-4}) to one in one million (1.0×10^{-6}) for incremental cancer risk at NPL sites. Risk levels at or above 1×10^{-4} are considered significant and generally warrant remediation. In order to account for simultaneous exposure to multiple carcinogens through a given pathway, the risks calculated for each individual carcinogen in that medium were summed to obtain an estimate of the total cancer risk for the pathway.

Non-carcinogenic effects are evaluated by comparing an exposure level over a specified time period (e.g., lifetime) with a reference dose (RfD) derived for a similar exposure period. To evaluate the non-carcinogenic effects of exposure to soil contaminants, the hazard quotient, HQ (the ratio of the exposure dose to the RfD) is calculated for each contaminant. The non-carcinogenic HQ assumes that below a given level of exposure (i.e., the RfD), even sensitive populations are unlikely to experience adverse health effects. If the exposure level exceeds this threshold there may be concern for potential non-carcinogenic health effects.

HQs are summed for each exposure pathway to create a pathway specific hazard index (HI) for each exposure scenario. The more the HI exceeds one (1), the greater the concern that adverse health effects will occur. The hazard quotient is not a percentage or probability.

The maximum concentration value was used as the exposure point concentration.

Current Land Use

Since there is no current activity at the GRS, the current land use scenario is not applicable.

Future Land Use

Under the future land use scenario, carcinogenic risks and non-carcinogenic hazards were calculated for exposure of the future on-unit resident (adult and child) to surface soils and air. The on-site resident scenario was used because it is more conservative than the industrial scenario.

The estimate of the total risk for carcinogens, for the future residential scenario, is 3.8×10^{-5} . The cancer risk for ingestion of soil at the Grace Road Site was 8.8×10^{-6} . Estimated risk was 4.7×10^{-8} for dermal contact with soils at the unit. The cancer risk for inhalation of particulate from soils at Grace Road is 2.9×10^{-5} , which is within the 1×10^{-4} to 1×10^{-6} range. Arsenic is the only contaminant responsible for the above risk estimates.

The non-carcinogenic hazard/risk (HI) for the soil pathways were calculated for adulthood and childhood exposures combined and for childhood exposure only. All of the exposure pathways for the on-unit resident have a non-carcinogenic hazard/risk of less than one. A summary of the risk presented by the chemical of concern, arsenic, is provided in Table 2. An analysis of data collected as a result of the studies performed at the Grace Road Site indicates that the GRS is not a risk to human health.

Ecological Risks

The ecological information base for Grace Road Site consists of a unit-specific threatened, endangered and sensitive species survey and a unit-specific ecological reconnaissance. Additional information is contained in the existing unit history, preliminary unit evaluation, and unit characterization data. These informational sources form the basis for this characterization. This information can be summarized as follows

- There is no evidence of vegetation stress or ecological impact related to the unit;
- There are no threatened or endangered species known to exist at or in the vicinity of the unit;
- Review of the unit characterization data indicates that there are no constituents in the physical media analyzed at Grace Road which are significantly different from the unit specific background condition.

Based on the physical and analytical data obtained for this unit, there is no compelling evidence that waste materials were managed or disposed at Grace Road. Therefore, it is reasonable to conclude that the unit, as it is currently characterized, presents no significant ecological risk.

Table 1. Comparison of unit specific **soil** concentration to two **times background** concentration and **Risk-Based Concentrations (RBCs)**

Contaminant (units)	Maximum Concentration	Average Bat_ Soil Concentration (GRS-10)	Two Times Background	RBC Value* (mg/kg)
Bis(2-ethylhexyl) Phthalate (mg/kg)	6.8	4.7	9.4	46
Carbon Disulfide (mg/kg)	0.002 J	Not Detected	Not Detected	7800
DDT(mg/kg)	0.0063 J	Not Detected	Not Detected	19
styrene (mg/kg)	0.004 J	Not Detected	Not Detected	16000
Acetone (mg/kg)	0.002 J	Not Detected	Not Detected	7800
Toluene (mg/kg)	0.003 J	Not Detected	Not Detected	16000
Di-n-Butyl Phthalate (mg/kg)	53 J	Not Detected	Not Detected	7800
Trichloroethylene (mg/kg)	0.004	Not Detected	Not Detected	58
Xylene (mg/kg)	0.007	Not Detected	Not Detected	160,000
Arsenic (mg/kg)	3.2	Not Detected	Not Detected	0.37
Barium (mg/kg)	48.4	Not Detected	Not Detected	5500
Cadmium (mg/kg)	1.8	Not Detected	Not Detected	39
Chromium (VI) (mg/kg)	29.6	4.2	8.4	390
Mercury (mg/kg)	0.15	Not Detected	Not Detected	23
Lead (mg/kg)	48.1	1.4	2.8	400**
Selenium (mg/kg)	1.3	Not Detected	Not Detected	390
Tin (mg/kg)	32.5	Not Detected	Not Detected	47000
Vanadium (mg/kg)	61.8	Not Detected	Not Detected	550
Zinc (mg/kg)	7.0	Not Detected	Not Detected	23000

* EPA Region III, Risk-Based Concentration Table, January-June 1995, dated March 7, 1995

J = **estimated value**

** The screening level for lead in soil is 400 **mg/kg** for residential land use. This value is described in OSWER Directive 9355.4-12, Revised Internal Soil Lead Guidance for **CERCLA** Sites and **RCRA** Corrective Action Facilities, dated July 14, 1994 and issued by Elliott P. Lewis of the USEPA. The screening level for lead was calculated using the USEPA new integrated exposure uptake **biokinetic** model with **default parameters**.

Table 2. **Carcinogenic/Non-Carcinogenic** Results for 3.2 **mg/kg** Arsenic.

Pathway	carcinogenic Risk Adult and Child (Unitless)	Non-carcinogenic Risk	
		Adult and Child (Unitless)	Child only (Unitless)
Dermal Contact	4.7×10^{-08}	0.00039	0.00026
ingestion	8.8×10^{-06}	0.15	0.14
Inhalation	2.9×10^{-05}	0.055	0.047
Total Risk	3.8×10^{-05}	0.2	0.19

SECTION IV.C SUMMARY OF THE CONSIDERED ALTERNATIVE

EPA OSWER Directive 9355.0-30 (EPA, 1991a) states, "where the cumulative carcinogenic site risk to an individual based on reasonable maximum exposure for both current and future land use is less than 1×10^{-4} , and the non-carcinogenic hazard quotient is less than 1, action is generally not warranted unless there are adverse environmental impacts." The remedial investigation for the Grace Road Site indicates that there is no impact to human health or the environment. Therefore, no action is needed at GRS and no other alternatives were considered

Description of Preferred Alternative

The No Action Alternative means that no remedial action will be performed at the Grace Road. No Five Year Review(s) will be conducted There is no waste to treat, no engineering controls required and there are no Applicable or Relevant and Appropriate Requirements (ARARs) or costs associated with this action. The alternative can be implemented immediately upon approval.

Although not necessary for this no action alternative, default institutional controls exist at SRS. Access to SRS is controlled by continuously manned barricades. The entire SRS facility is surrounded by an exclusion fence, except along the Savannah River. The Site is posted against trespassing under state and Federal statutes.

SECTION IV.D. SUMMARY OF THE NO ACTION ALTERNATIVE

According to EPA guidance document 9355.3-02 (EPA, 1989), if there is no current or potential threat to human health and the environment and no action is warranted, the CERCLA 121 requirements are not triggered. This means that there is no need to evaluate other alternatives or the no action alternative against the nine criteria specified under CERCLA.

Since the no action alternative is warranted, it satisfies the CERCLA criteria The no action alternative will be the final action for the Grace Road Site. This solution is meant to be permanent and effective in both the long and short term. No Five Year Review will be conducted The no action decision is the least cost option with no capital, operating, or monitoring cost and is protective of human health and the environment. Additionally, this plan provides for community involvement through a document review process and a public comment period. Public input will be documented in the ROD.

GLOSSARY

Administrative Record File: A file that is maintained and contains all information used to make a decision on the selection of response action under the Comprehensive Environmental Response, Compensation, and Liability Act. This file is to be available for public review, and a copy is to be established at or near the Site, usually at one of the information repositories. Also, a duplicate file is held in a central location, such as a regional or state office.

ARARs: Applicable or Relevant and Appropriate Requirements. Refers to the federal and state requirements that a selected remedy will attain. These requirements may vary from site to site.

Baseline Risk Assessment: An analysis of the potential adverse health effects (current or future) caused by hazardous substance release from a site in the absence of any actions to control or mitigate these releases.

Characterization: The compilation of all available data about waste units to determine the rate and extent of contaminant migration resulting from the waste site, and the concentration of any contaminants that maybe present.

Contamination: The deposition of unwanted chemical and/or radioactive material at a site.

Exposure: Contact of an organism with a chemical or physical agent. Exposure is quantified as the amount of the agent available at the exchange boundaries of the organism (e.g., skin, lungs, digestive tract) and available for absorption.

Federal Facility Agreement (FFA): A legally binding agreement between regulatory agencies (EPA and SCDHEC) and regulated entities (DOE) that sets standards and schedules for compliance with environmental laws.

Magnetometer. A device used to locate buried metallic objects which create a measurable disturbance in the magnetic field of the earth.

Media: A pathway through which contaminants are transferred. Five media by which contaminants maybe transferred are groundwater, soil, surface water, sediments, and air.

National Priorities List (NPL): Formal listing of the nation's worst contaminated sites, as established by the Comprehensive Environmental Response, Compensation, and Liability Act.

Operation and Maintenance (O&M): Activities conducted at a site after a response action occurs to ensure that the cleanup and/or systems are functioning properly.

Parts per Billion: A unit of measure of concentration equivalent to the weight/volume or weight/mass ratio expressed as ug/L or ug/kg, respectively.

Parts per Million: A unit of measure of concentration equivalent to the weight/volume or weight/mass ratio expressed as mg/L or mg/kg, respectively.

RCRA Part B Permit Application. The second part of the permit application that includes detailed and highly technical information concerning the treatment, storage and disposal (TSD) facility in question. There is no standard form for the Part B; instead the facility must submit information based on the regulatory requirements.

Reduction of Toxicity, Mobility, and Volume through Treatment. The assessment against this criterion evaluates the anticipated performance of the specific treatment technologies an alternative may employ.

Resource Conservation and Recovery Act (RCRA): Resource Conservation and Recovery Act of 1976. What is commonly referred to as RCRA is an amendment to the first pieces of federal solid waste legislation called the Solid Waste Disposal Act of 1970. RCRA was amended in 1980 and most recently on November 8, 1984 by the Hazardous and Solid Waste Amendments (HWSA).

Record of Decision (ROD): A legal document that describes the final remedial actions selected for a Superfund site, why the remedial actions were chosen and not others, how much they will cost, and how the public responded to the proposed remedial actions.

Responsiveness Summary: A summary of oral and/or written public comments received during the proposed plan comment period.

Superfund: The common name used for the Comprehensive Environmental Response, Compensation, and Liability Act. The Superfund program was established to help fund cleanup of hazardous waste sites. It also allows for legal action to force those responsible for the sites to clean them up.
