ABSTRACT

This report summarizes observations that were made during a Quality Assurance (QA) Baseline Assessment of the Nuclear Materials Technology Analytical Chemistry Group (NMT-1).

The Quality and Planning personnel, for NMT-1, are spending a significant amount of time transitioning out of their roles of environmental oversight into production oversight. A team from the Idaho National Engineering and Environmental Laboratory Defense Program Environmental Surety Program performed an assessment of the current status of the QA Program. Several Los Alamos National Laboratory Analytical Chemistry procedures were reviewed, as well as Transuranic Waste Characterization Program (TWCP) QA documents. Checklists were developed and the assessment was performed according to an Implementation Work Plan, INEEL/EXT-98-00740.

The bases for the assessment were the requirements found in the Department of Energy Carlsbad Area Office and TWCP QA documents (specifically the Quality Assurance Program Document and Quality Assurance Program Plan). In areas where the TWCP requirements were not applicable, good laboratory practices were applied.

Several observations were made during the assessment. This report has grouped the specific observations into several general observations and recommendations.

Based upon this assessment, NMT-1 can plan and implement improvements to the quality management system to meet customer changing needs. Additionally, this assessment will serve as the foundation for achieving certification to analyze samples for the TWCP.

SUMMARY

The purpose of this assessment was to evaluate the current status and provide a conduit for implementing improvements to the quality management system in the Nuclear Materials Technology (NMT) Analytical Chemistry Group (NMT-1) at Los Alamos National Laboratory (LANL).

During the course of the assessment many observations were made. This report focuses on the non-compliant observations and those that deviate from good laboratory practices, but it should be noted that several instances of good laboratory practices were observed.

In using the Transuranic Waste Characterization Program (TWCP) Quality Assurance (QA) requirements, as the bases for this assessment, it has been determined that NMT-1 is not prepared to obtain the TWCP certification. This does not indicate that this level of certification is unachievable by NMT-1. With a concerted effort, made by all available resources, NMT-1 could obtain this work as well as other similar projects.

The conclusion made from this assessment was the basic processes and procedures for implementation of better quality operations by NMT-1 are in place. However, the procedures need updating to accurately describe practices at NMT-1. Personnel appear to be open to the development and implementation of an improved process. The management team has begun the work of conveying group expectations, goals, and objectives, but the root of the problem lies in inconsistencies in implementation of the procedures.

These inconsistencies may be due to the recent reorganization and transition from a research and development environment to a more production oriented environment, but it is imperative that these inconsistencies be alleviated, in order for the group to move forward in their improvement effort.

The Idaho National Engineering Laboratory (INEEL) team determined that due to the nature of this assessment, it being a baseline overview, an Action Plan would not be prudent at this time. It is expected that NMT-1 will generate a plan of action for implementation of QA program improvements.

ACKNOWLEDGMENTS

The author acknowledges the members of the INEEL Defense Programs Environmental Surety Program (DPESP) Assessment Team, Joan Connolly, Steve McKinney, Robert Thompson, and Don Wood, for providing their support and expertise during all phases of the Quality Assurance Baseline Assessment.

Quality Assurance Baseline Assessment Report For LANL Analytical Chemistry NMT-1 Operations

1. INTRODUCTION

In FY-96, the Department of Energy (DOE) Defense Programs (DP) and the Idaho National Engineering and Environmental Laboratory (INEEL) Laboratory Director embarked on an innovative effort to integrate DOE Environmental Management (EM) skills with DOE-DP production skills and needs. The following policy statement was developed and used to form an agreement with the INEEL.

“Using a systems engineering approach, the INEEL will work with the existing weapons production designers to ensure environmentally sound techniques are used during each stage of the production life. INEEL will work cooperatively with the other Defense Program laboratories and sites to assure that all environmental laws are obeyed in the most cost-effective manner and the best engineering practices will be applied.”

This effort produced a Memorandum of Agreement (MOA) signed by the DOE Albuquerque (DOE-AL) and Idaho (DOE-ID) Operations Offices, that specifically, includes performance of facility assessments of various operations at Los Alamos National Laboratory (LANL).

One of the items tasked in the MOA was to perform a Quality Assurance (QA) Baseline Assessment of the newly organized Nuclear Material Technology (NMT) Analytical Chemistry Group (NMT-1).

After further discussion, with the NMT-1 management team, it was determined that the focus of the assessment should be on improvements needed to obtain certification to perform analyses of samples for the Transuranic Waste Characterization Program (TWCP). In light of this, the assessment team determined that the DOE Carlsbad Area Office (CAO) and TWCP QA documents, specifically the Quality Assurance Program Plan (QAPP) and the Quality Assurance Program Document (QAPD), would be used as a basis for the assessment. It was also noted that not all operations of NMT-1 would be applicable to the rigor of these requirements, but when possible the TWCP requirements would be considered using a graded approach. In cases where this was not practical, good laboratory practices were applied.

An assessment team was formed with a QA Engineer and four chemists with various backgrounds and laboratory experience. The team members were assigned Task Areas/analytical methods, to ensure that a complete overview of NMT-1 was performed. The details of the assessment process are in the *“Implementation Work Plan for the Baseline Quality Assurance Assessment of the NMT-1 Analytical Chemistry Laboratory at LANL”*, INEEL/EXT-98-00740, August 1998.

The assessment was performed August 10 –14, 1998. Checklists were used as an assessment tool (see Appendix A).

2. DISCUSSION

Each of the NMT-1 Task Areas were evaluated according to INEEL/EXT-98-00740, *Implementation Work Plan for the Baseline Quality Assurance Assessment of the NMT-1 Analytical Chemistry Laboratory at LANL*. This section includes general statements based upon specific observations (including procedure reference and Task Area) that are maintained in an INEEL DPESP file.

This section is formatted to correlate with relevant subsections of the DOE-CAO QAPD and QAPP, to facilitate referring to those documents for the specific requirements.

2.1 Organization and Quality Assurance Program

2.1.1 Organization

Reference

Both the QAPD (1.1.1) and QAPP (1.1) contain functional organization charts showing lines of authority and levels of communication.

Observation

The organization chart reviewed by the assessment team did not reflect the most current changes made in NMT-1.

Recommendation

Revise the organization chart to include the current changes made within NMT-1. It is understood that the group is still in transition to NMT Division, but special effort should be made to keep the organization chart up-to-date. The assessment team was given a copy of the NMT-1 Group Roster that contained titles of the work groups, under each Task Area. These work groups should be included in the functional organization chart. The production of this type of organizational chart should be included in QA-1 or in an implementation plan. This chart will also be useful for anyone needing information on the structure of NMT-1.

2.1.2 Communication

Reference

QAPD 1.1.1.6 discusses communication responsibilities. Communication channels shall be established "that provide timely, routine and wide dissemination of information pertinent to quality performance . . ."

Observation

Currently, customer requirements are conveyed informally (e.g., phone calls, office visits, etc.), usually between the customer and a Task Area Leader. This system may provide adequate information for cost estimating and building profile lists, but the information is not documented appropriately or disseminated to all personnel.

Recommendations

Customer requirements and other pertinent information should be clearly understood, agreed upon, and accessible to all personnel. These requirements should be documented and communicated through a formalized process.

A formalized means of documenting customer requirements should be established. The use of the Analytical Service Agreement could be extended to document these requirements. Another suggestion would be to revise and utilize the Analytical Chemistry Working Agreement or develop a generic Statement of Work document. This information should then be disseminated to each Task Area, as applicable.

2.1.3 Interface Responsibilities

Reference

QAPD 1.1.1.6 discusses interface responsibilities. When more than one organization (internal or external) is involved in executing activities, each organization's responsibility and authority shall be clearly established and documented.

Observation

It was not evident to assessment team members that a formalized system exists in which customer requirements and other requirements are communicated and documented within NMT-1. See comments in Section 2.1.2. Again, interface with others is performed in an informal manner.

Recommendations

Interface responsibilities may be established and documented through a procedure. These responsibilities can be easily combined with the communication responsibilities needed for Section 2.1.2. All customers and personnel interacting with NMT-1 should also review this procedure.

The formalized means of documenting customer requirements established (in Section 2.1.2) should be a required process for all customers to initiate and/or complete.

2.1.4 QA Program Documents

Reference

QAPD 1.1.2.1, states that "each program participant shall develop and follow procedures that effectively implement the requirements described herein . . ."

Observation

The NMT-1 Quality Assurance Management Plan (QA-1) does not include the requirements for the TWCP, as written in the QAPD and QAPP. Also, this document contains references to the CST Division.

Recommendations

QA-1 must be rewritten to reflect the changes made in the organization structure. Changes should also be made to reflect the way that the QA program will be implemented in NMT-1. Areas (not all-inclusive) that should be incorporated or expounded upon are roles and responsibilities,

delegation of work, dispute resolution, and graded approach. These items are discussed in the QAPD (Section 1, Management Requirements) and the QAPP (Section 1, Program Management). Refer to Table 1.1 of the QAPP, which provides a cross-reference of QA requirements in relationship to the QAPD, 10 CFR 830.120, and ASME NQA-1.

In order to perform work in support of the TWCP the QA requirements found in the DOE-CAO QA documents must be incorporated into an NMT-1 procedure. This could be performed by making additions to QA-1, or by writing a Quality Assurance Project Plan (QAPjP) or an implementation plan specifically for the TWCP.

Develop a procedure dictating the minimum QA requirements that all NMT-1 customers will receive. This procedure may include dictating minimum Quality Control (QC) requirements for analyses and data reporting criteria.

2.1.5 Procedures Matrix

Reference

QAPD 1.1.2.2 states that a procedures matrix shall be prepared and maintained that identifies all current and applicable documents.

Observation

In several cases, it was unclear to the assessment team which documents were applicable to this assessment. The procedures matrix found in LANL TRU Waste QA Management Plan (TWCP-PLAN-0.2.6-001, R.1) does not reflect the changes made in NMT-1.

Recommendation

The procedures matrix should be revised to incorporate all of the documents applicable to the TWCP. It is also suggested that a general document hierarchy chart (see QAPP Figure 1-2) be created that lists all documents applicable to NMT-1. It was noted that Quality and Planning Task Area personnel are working on revising the procedures matrix for the TWCP.

2.1.6 Planning Work

Reference

QAPD 1.1.2.5 states that "planning shall be performed and documented to ensure that work is accomplished under suitably controlled conditions." This planning process should be documented and should include scheduling and resource considerations.

Observation

There is not a formal system in place to ensure that analyses are completed on time, using appropriate methods (profiles), meeting all Quality Control (QC) requirements, and adhering to cost and schedule.

Recommendations

Formalize the work planning process through QA-1 or other procedure.

Take a project management approach to individual projects by assigning one person or a team of people to handle customer requirements, scheduling, information dissemination, sample tracking, resource loading, etc. An example, the current use of an NMT-1 employee, located at TA-55, who is managing and coordinating, with CMR personnel, the analytical samples from the Plutonium Facility.

2.2 Personnel Qualification and Training

2.2.1 Qualification and Training

Reference

QAPD 1.2 discusses personnel qualification and training requirements. These requirements shall be established and documented. At a minimum, education, experience, and training (including on-the-job [OJT]) requirements should be identified.

Observations

After reviewing Table 1-4 of the QAPP (training and qualification requirements) it seemed evident that NMT-1 personnel should meet the qualifications required to perform work in support of the TWCP.

The Individual Training Plans that were reviewed only listed site-wide training and did not include OJT.

Recommendations

Qualification and training requirements should be documented in a procedure or other means. Personnel qualifications and training should be documented and placed in either personnel or training files.

Individual Training Plans should be revised to incorporate OJT requirements.

Develop lesson plans for OJT and proficiency training on analytical systems (equipment/profiles). These plans can then used as documentation of personnel qualification.

Conduct training on new and revised procedures, depending on the extent of the changes, instead of using required reading. Required reading has its place, but in the course of making major changes this is not be effective. This training should be delegated to a Task Area or Technical Leader.

2.2.2 Special Training Requirements

Reference

QAPP 1.6 states that before performing activities that affect program quality, all personnel are required to receive indoctrination regarding the scope, purpose, objectives, and specific QA objectives.

Observation

It was noted in several interviews of NMT-1 personnel that the purposes of the QA function and overall goals and objectives for the group were not known.

Recommendations

Develop and present an indoctrination class to all NMT-1 personnel that discusses goals and objectives, general criteria, QA Plans, codes and regulation, implementing procedures and how these items correlate to the TWCP and other programs/projects supported by the group.

Actual training exercises on each revised QA document may also be useful.

2.3 Quality Improvement

2.3.1 Nonconformance/Corrective Action

Reference

QAPD 1.3, requires processes be established and implemented to detect and prevent conditions adverse to quality.

Observation

Several nonconformance issues were found throughout the laboratories. In many cases, these nonconformances were recognized by employees to exist, but the issues were not documented and corrective action put into place for resolution. In some cases personnel were unsure of the process to follow to correct these issues.

Recommendation

Review procedures to ensure that conformance information has been incorporated (e.g., tolerance limits for daily analytical balance checks). Review existing or write new procedures on managing nonconformance issues and performing corrective actions. Personnel should be trained on the appropriate use of these procedures.

2.3.2 Operational Variance

Reference

QAPP 2.1.2.2 addresses the issue of operational variances. It is understood that there will be situations in which "the need of a variance is caused by identification of improvements opportunities or unusual or nonroutine occurrences that affect operations but not the ability to achieve the performance standards or quality requirements."

Observation

Many of the nonconformance issues identified, by the INEEL team, had to do with equipment calibrations not being performed as scheduled. An example, many instances were observed of the annual calibration of an analytical balance being past due, while still being used to process samples.

Recommendation

A program should be established that allows for operational variances. This program should include use of a Record of Variance form that could be approved by Task Area Leaders. This program would allow continuance of the activity for a specified time period. As in the example, continued use of the balance would be approved, contingent upon acceptable performance of daily calibration checks, until the annual calibration is performed.

2.4 Documents

2.4.1 General Requirements

Reference

QAPD 1.4.1 states that documents "shall be prepared, reviewed, approved, issued, used, and revised to prescribe processes, specify requirements, or establish design."

Observations

There are two distinct document control processes in NMT-1. One system for normal routine operations and another, more rigorous, system for the Source-Term Waste Test Program (STTP).

QA-1 does not give enough detail pertaining to the document control process, i.e. actual tasks performed to establish and control documents, steps to initiate changes to documents, configuration management, etc.

Recommendations

A separate procedure should be written that specifically describes steps taken in all aspects of document control, including configuration management.

The document control system should integrate the current requirements for the STTP and use this program as a guideline for control of all NMT-1 documents.

See additional recommendations in sections 2.4.2 and 2.4.3 of this report.

2.4.2 Document Review

Reference

QAPD 1.4 states that documents "shall be reviewed for adequacy, correctness, and completeness."

Observations

Several of the procedures reviewed were not being followed as written.

Many of the procedures reviewed, contained references to the CST Division.

There were a few redundant procedures in place.

It was noted that some personnel were working from a revised procedure that had not yet completed its review cycle.

Some procedures were found to be past the review due date.

Recommendations

All of the NMT-1 procedures should be reviewed, revised (as needed), trained to (as needed), and redistributed. It was noted that some of the procedures were well written and complete, but all of should be reviewed for content and implementation feasibility.

Redundant procedures should be consolidated.

The procedure review process should be evaluated and revised to ensure that documents are reviewed quickly and efficiently.

The adequacy of the tickler system for procedure reviews should be evaluated and revised to prevent the occurrence of past due document reviews.

2.4.3 Document Distribution

Reference

QAPD 1.4.2.2 discusses distribution and use of controlled documents. One of the requirements is that documents "shall be distributed to affected personnel and used at the work location."

QA-1 states that all "Analytical Chemistry personnel are responsible for maintaining a current procedure notebook or file of their printed documents."

Observation

It is unclear how readily accessible current copies of the procedures are to personnel. There is an on-line distribution system in which a current hard copy of a controlled procedure may be obtained, but hard copies were not observed in all of the work areas.

Recommendations

Procedures should be readily available to all personnel. A suggestion is to assign a document control person who creates binders containing hard copies of relevant procedures for each Task Area or work area. This would alleviate the need for each person to have a current procedure notebook or file. This person would then be responsible for keeping the information in these binders current.

Alternatively, an intranet web site could be created in which the procedures may be accessed and printed as needed.

2.5 Records

2.5.1 General Requirements

References

QAPD 1.5.1 states that records “shall be specified, prepared, reviewed, approved, and maintained.”

QAPD 1.5.2 discusses additional requirements such as generating, indexing and classifying records.

Observation

It was not clear whether all relevant documents have been identified as QA records. The list of documents in QA-1 should be reviewed for completeness.

Recommendation

QA and general records for NMT-1 need to be clearly defined. Defined records should be managed as dictated in subsequent steps of QAPD 1.5.2. Refer to Table 1.5 in the QAPP for list of QA records.

2.5.2 Records Storage

Reference

QAPD 1.5.2.6 states that “QA records shall be stored and preserved in predetermined storage facilities.”

Observation

Potential QA and general records are being stored in individual offices, for indefinite periods of time. These documents are not being stored properly (i.e., in fire rated cabinets).

Recommendation

A centralized, easily accessible storage facility should be put into place.

2.6 Work Processes

2.6.1 Work

Reference

QAPD 2.1.1 discusses requirements for actual performance of tasks. Issues discussed include, but are not limited to the following: work shall be performed under controlled conditions using approved procedures; personnel performing work are responsible for the quality of their work.

Observations

The technical excellence of the work that is being performed by NMT-1 personnel is not in question. Most observations revealed that the analyses (profiles) being performed are technically sound.

Procedures are not written to reflect the way tasks are actually performed.

Recommendations

Procedures should be reviewed for content and implementation feasibility. Procedures should be revised to read as the tasks are being performed or personnel should be required to follow the procedures as written. The importance of procedure compliance should be clearly communicated to personnel.

Conduct training on new and revised procedures, depending on the extent of the changes, instead of using required reading. Required reading has its place, but in the course of making major changes this may not be effective. This should be delegated to the Task Area or Technical Leader.

Expand administrative and technician staff to perform tasks, that are less technical in nature, such as data compilation/gathering, data entry (in spreadsheets and in the Laboratory Information Management System [LIMS]), data packaging, and data/sample tracking.

2.6.2 Acceptable Work Performance

Reference

QAPD 2.1.1 establishes management involvement in the work processes through interactions with personnel and through review and verification of ongoing and completed work. Acceptable work performance must be clearly communicated and personnel must have the necessary training and resources to accomplish their tasks.

Observation

Generally, it is unclear as to how resource loading, work control, and overall of tracking of work is performed.

Recommendations

A formalized system should be put into place to plan and track the work that is being performed.

Resource loading issues should be addressed in order to determine whether adequate resources are available to perform work for the TWCP or any additional projects.

2.7 Inspection and Testing

2.7.1 Use and Control of Measuring and Test Equipment (M&TE)

Reference

QAPD 2.4.3.1 states, "establish and document a system to control the use and calibration of M&TE." A program should be in place "to recall for calibration, or remove from service, M&TE that has exceeded its calibration interval."

Observation

There were several instances of equipment (e.g., analytical balances, pipettes, and thermometer) past the calibration due date and still in use. It was noted through discussions that the calibration program issue is a site-wide problem.

Recommendations

Despite the site-wide issue, M&TE should be placed out-of-service until recalibrated.

A program should be established that allows for operational variances. This program should include use of a Record of Variance form that could be approved by Task Area Leaders. This would then allow continuance of the activity for a specified time period.

Form a qualified NMT-1 calibration team. There are many pieces of equipment in NMT-1 that need consistent calibration. In light of the "site-wide" issues, this may be an option.

2.7.2 Calibration of M&TE

References

QAPD 2.4.3.1 requires that records documenting that M&TE schedules and procedures have been followed.

QAPD 2.4.3.2 states that M&TE requiring calibration is done so at specified intervals.

Observation

There is a system, in place, to track items in need of calibration, which also has the ability to track all other routine, dated activities. This system is currently not being used by all Task Areas. Unfortunately, this tracking system does not preclude the problems associated with actual performance of the required calibration activities.

Recommendations

Frequency of calibration should be clearly defined and known by personnel (i.e., calibration of pipettes). These frequencies should be written in procedures.

The current tracking system should be reviewed and expanded for use by all Task Areas.

2.8 Assessment and Oversight

2.8.1 Management Assessments

Reference

QAPD 3.1 states "managers at every level shall periodically assess the performance of their organization . . . This assessment shall place emphasis on the use of human and material resources to achieve organizational goals and objectives." These assessments shall be conducted regularly and reported at least annually.

Observation

No documentation was observed to support the performance of periodic management assessments.

Recommendation

Management assessments should be performed periodically. This task may be delegated to staff members, but it is the sole responsibility of management personnel to ensure that they are being completed. These assessments should be documented and contents distributed to personnel for review. It is also suggested that a schedule (including areas to be assessed) be posted for personnel information.

2.8.2 Independent Assessments

Reference

QAPD 3.2 states "planned and periodic independent assessments shall be conducted to measure item and service quality, process effectiveness, and to promote improvement." A program of surveillances and audits shall be planned, performed, documented, and reported to management personnel.

Observation

Periodic independent assessments are being performed by personnel external to NMT-1, but not by personnel internal to NMT-1.

Recommendations

Independent assessments should be performed periodically. QA personnel may perform this task, since they do not perform actual chemical analyses. The purpose of these assessments should be to ensure compliance with the QA program and procedures. These assessments should be documented and contents distributed to personnel for review. It is also suggested that a schedule (including areas to be assessed) be posted for personnel information.

In light of the reorganization and potential changes in the type of samples to be worked at NMT-1, higher visibility and management recognition of the QA staff is very important.

2.9 Sample Management

2.9.1 Sample Control

Reference

QAPD 4.1 requires that provisions be made for the "identification, handling, storage and shipping, archival, and disposition of the samples."

Observation

The sample management process is viewed as the hub of any analytical chemistry laboratory. There were several inconsistencies noted in NMT-1's sample management process (e.g., sample receipt and sample log-in) and it was not always clear as to how certain tasks (e.g., building profile templates) are performed.

Recommendations

Review and revise current Sample Management procedures to reflect the way samples are actually being managed in NMT-1.

All NMT-1 personnel should understand and be trained to the sample management process. Each person should understand how his or her specific task fits into the overall process.

2.9.2 Sample Possession/Chain-of-Custody (COC)

Reference

QAPD 4.1 requires that “implementing procedures shall define responsibilities, including organizational interfaces, related to documenting and tracking sample possession . . .” at all stages of sample handling.

Observations

Currently, most of the samples received in the group do not require formal COC because it is not dictated by the projects being worked. It was not clear as to how samples are tracked within the Sample Management Task Area.

Currently, the individual Task Areas track samples in the work areas, using spreadsheets (i.e., Excel), which reside on individual personal computers.

Recommendations

A minimum level of tracking and custody should be established for the group.

The COC procedure should be reviewed and revised to handle various levels of rigor in receiving and distributing of samples.

The use of spreadsheets for tracking samples may be an acceptable practice, but the information should be incorporated into LIMS to enhance the overall use of the LIMS.

2.9.3 Disposition of Samples

Waste management was outside of the scope of this assessment and therefore not evaluated.

2.10 Data Management

2.10.1 Data Recording

Reference

QAPD 5.3.1 states “the method of data recording (e.g., scientific notebooks, log books, data sheets, or computerized instrumentation systems) shall be controlled to avoid data loss and permit data retrievability.”

Observations

The technical capabilities of NMT-1 personnel are not at question, but what is of concern is the ability to generate reproducible and defensible data (refer to SW-846, Chapter One), through proper management of that data.

Some data is not being recorded properly, i.e. in indelible ink, recorded daily, etc.

Results are not always entered into the LIMS.

There were several instances in which the use of logbooks did not follow the NMT-1 procedure on logbooks and notebooks.

Recommendations

A procedure should be written that governs method of recording data, including requirements for entering data into the LIMS.

Obtain list of all logbooks, currently in use and review for content. Determine if they comply with procedure and if they are actually needed.

Create pre-printed logbook pages that could be bound, to ensure that necessary and relevant information is being recorded. This is especially helpful for maintenance and calibration logbooks.

2.10.2 Data Transfer and Reduction

Reference

QAPD 5.3.1 states “controls shall be established to ensure that data transfer is error free (or within a prescribed permissible error rate); that no information is lost in transfer; and that the input is completely recoverable.”

Observation

There are several spreadsheets that are being used, in various Task Areas, in which the data is being calculated and reduced then downloaded directly into the LIMS.

Recommendations

A procedure should be written that formalizes the process of data transfer and reduction.

Good examples of the spreadsheets should be evaluated for use throughout the group.

Use examples, from various Task Areas, of spreadsheets that currently download data automatically to the LIMS.

2.10.3 Data Collection, Analysis, and Reporting

Reference

QAPD 5.3.1 states “data collection and analysis shall be critically reviewed and questions resolved before results are either used or reported.”

Observation

Results are not always entered into the LIMS for reporting and final approval. There were instances in which data (results) were reported verbally to a customer without further documentation.

Recommendations

A procedure should be written that formalizes the process of data collection, analysis, and reporting.

All data should be documented and reviewed (including logbooks) before being reported.

Report generation activities (including data packaging, where applicable) should be evaluated to establish a more efficient process. Currently, this job is very cumbersome in some Task Areas.

2.10.4 Data Validation

Reference

QAPP 3.2 requires that “validation of all data (qualitative as well as quantitative) shall be performed so that data used for WIPP compliance programs will be of known and acceptable quality.”

Observation

Documentation of method performance was not always evident. Control charts were produced at various frequencies and in some cases, not at all.

Recommendation

Procedures should be reviewed to ensure there is a process of documenting method performance. This may include periodic precision and accuracy evaluations and control chart production. The frequency of performing these tasks should be clearly defined.

2.11 Software Control

2.11.1 General Requirements

Reference

QAPD 6.1 discusses software quality assurance (SQA) requirements, including inventory, classification, verification, validation, configuration management, and documentation of software.

Observations

Many spreadsheets (non-commercial software) are being used throughout the group, to track, manipulate, calculate, and report data. There is no evidence that these spreadsheets have been inventoried, validated, verified, and approved for use. There has been an attempt, in one of the Task Areas, to begin the validation/verification process.

It was also noted that many of the spreadsheets, used in various Task Areas, are very effective.

Recommendations

The process of maintaining SQA should be written in a procedure, specifically for the use of spreadsheets. All information should be documented.

As a means to increase the efficiency, in certain Task Areas, the effective spreadsheets from other Task Areas should be modeled.

Obtain a list of all spreadsheets. All of these spreadsheets will need to be tracked, controlled, validated, verified, and approved.

A separate INEEL team will perform a more in depth software quality assurance (SQA) assessment.

2.12 General

2.12.1 LIMS

References

Environmental Protection Agency (EPA) Good Automated Laboratory Practices, 1990.

EPA Good Automated Laboratory Practices Implementation Assistance, 1995.

Observations

The LIMS is not being used to its fullest capabilities. Personnel seem reluctant to enter data, utilize tracking functions, utilize potential data calculation and manipulation functions, etc.

There were several instances of inconsistent sample log-in and data entry into the LIMS.

Recommendations

LIMS is a tool that should be used and modified, if applicable, to enhance work processes and increase overall efficiencies of NMT-1 operations.

Management should continue to stress the importance and set requirements for the use of the LIMS. Requirements and use of the LIMS should be written in a procedure. The EPA GALP document is a good source of information for LIMS.

2.12.2 Conduct of Operations

Reference

DOE Order 5480.19, Conduct of Operations.

Observation

Several Conduct-of-Operations concerns were raised during this assessment. One example is the use of operator aids in the laboratories. An example, an operator aid on a sample preparation procedure, posted in the work area, deviated from the actual analytical (ANC) procedure.

Recommendations

Operator aids, in many cases, are essential to increasing the efficiency of work process, but these aids should be documented and controlled, to ensure controlled procedures are not being violated.

The area of Conduct of Operations was out of the scope of this assessment, but should be reviewed for NMT-1 operations.

Assessment Questions and Procedures	Response	Reference	Comments
1. Has the laboratory manager been identified?	Y N		
2. Has the laboratory QA officer been identified?	Y N		
3. Has a sample custodian been identified?	Y N		
4. Does the QA Office have B.S. + 3yrs. Related experience?	Y N		
5. Does the QA Officer ensure all data packages are reviewed before release to the customer?	Y N		
6. Has a sample custodian been identified?	Y N		
7. Has a document custodian been identified?	Y N		
8. Are QC responsibilities and reporting relationships clearly defined?	Y N		

Assessment Questions and Procedures	Response	Reference	Comments
9. Have all laboratory personnel been trained according to site requirements?	Y N		
10. Are all QA procedures and revisions documented in written form and assigned a unique identification code including date of implementation?	Y N		
11. Are all procedures and protocols implementing the QA program approved by the QA officer and laboratory management prior to usage?	Y N		
12. Has a formal corrective action program been implemented?	Y N		
13. Are the following elements of a QA and QC program adequately covered, maintained, and implemented by QA Plan and/or SOPs:	Y N		
a. Organization and Personnel, including policy, assignment of responsibilities, & QA/AC procedures?	Y N		
b. Training & Qualification, including minimum qualifications necessary for each position?	Y N		
c. Nonconformance Reporting including identification, reporting, corrective action, and notifications to INEEL SMO?	Y N		
d. Document Control including review, control, release, revision, retention, and configuration management practices?	Y N		
e. Calibration including use of standards traceable to NIST, EPA, or DOE primary standards?	Y N		
f. Use of control charts?	Y N		
g. Material control for material purchased for use in analytical processes?	Y N		
h. QC samples including LCS, blanks, and duplicates?	Y N		
i. Audits (internal and external) including: annual audit of laboratory, auditor qualifications and organizational freedom, reporting (both internal and to INEL SMO)?	Y N

Assessment Questions and Procedures		Response	Reference	Comments
17.	Are records maintained in a logbook of all instrument maintenance?	Y N		
18.	Have the instruments been maintained in accordance with the applicable QA and QC manual and/or instrument operations manual?	Y N		
19.	Are unknown, round-robin performance evaluation standards from EPA routinely analyzed? a. Are results documented? b. Are all results within applicable QC limits? c. Have corrective actions been documented?	Y N		
20.	Are quality control charts maintained for check sources and backup checks?	Y N		
21.	Does the analytical and QC data meet the QC criteria as specified in the applicable QAPJP, SAP, and QA and QC manuals?	Y N		
22.	Do QC records show corrective action when analytical results fail to meet QC criteria?	Y N		
23.	Are quality control data accessible for all analytical results? Are data calculations documented?	Y N		
24.	Are data calculations checked by a second person?	Y N		
25.	Do supervisory personnel routinely review the data and QC results?	Y N		
26.	Are all data and records retained under security for the period required by the applicable project QA plan and applicable sampling and analysis plans?	Y N		
27.	Does the laboratory appear to have adequate work space?	Y N		
28.	Are document custody procedures written and accessible to all appropriate individuals?	Y N		
29.	Are written document preparation and custody procedures available to all appropriate personnel?	Y N		

Assessment Questions and Procedures	Response	Reference	Comments
30. Does the facility include adequate areas for: a. sample receipt, b. storage, c. sample preparation, & d. analyses?	Y N		
31. Does the facility include adequate areas for: a. sample receipt, b. storage, c. sample preparation, & d. analyses?	Y N		
32. Does the laboratory maintain project files which include all samples and laboratory custody and analysis data, documents, and records?	Y N		
33. Are all documents in a project file uniquely and sequentially numbered?	Y N		
34. Does the facility have a secure designated area where all laboratory and sampling records are stored?	Y N		
a. Is access to this area restricted to authorized individuals?	Y N		
b. Are all records maintained permanently?	Y N		
c. Is a master inventory list maintained?	Y N		
d. Are records presently as represented by the inventory?	Y N		

Appendix B

Supplier Quality Assurance System Evaluation

NQA-1 Basic Requirements

Appendix B

Supplier Quality Assurance System Evaluation NQA-1 Basic Requirements

NQA-1 Basic Requirements Checklist		Ref.	Yes	No	Notes
1.0	<u>Organization</u>				
1.1	Is the supplier's organizational structure, functional responsibilities, and levels of communication for activities affecting quality documented?	BR-1			
1.2	Does the supplier's program specify that persons or organizations responsible for assuring that an appropriate quality assurance program has been established, and for verifying that activities affecting quality have been correctly performed, have sufficient authority to access work areas, and organizational freedom to:	BR-1			
1.2.1	identify quality problems;				
1.2.2	initiate, recommend, or provide solutions to quality programs through designated channels;				
1.2.3	verify implementation of solutions;				
1.2.4	assure that further processing, delivery installation, or use, is controlled until proper disposition of a nonconformance or deficiency, has occurred?				
1.3	Do such persons or organizations have sufficient independence from cost and schedule considerations?	BR-1			
2.0	<u>Quality Assurance Program</u>				
2.1	Has a documented quality assurance program been planned, implemented, and maintained in accordance with NQA-1 or equivalent?	BR-2			
2.3	Does the program take into consideration the technical aspects of the activities affecting quality?	BR-2			
2.4	Does the program provide control over activities affecting quality to an extent consistent with their importance?	BR-2			
2.6	Does the program provide for the planning and execution of activities affecting quality under controlled conditions?	BR-2			
2.6.1	using appropriate equipment,				
2.6.2	providing suitable environmental conditions for the activity, and				
2.6.3	providing assurance that prerequisites for the activity have been satisfied?				
2.7	Does the program provide for special processes, test equipment, tools, and skills to achieve quality requirements?	BR-2			

NQA-1 Basic Requirements Checklist		Ref.	Yes	No	Notes
2.8	Does the program provide for quality verifications, such as inspections, tests, audits, surveillances, and reviews?	BR-2			
2.9	Does the program provide indoctrination and training of personnel performing activities affecting quality and assure that proficiency levels are maintained?	BR-2			
2.10	Does management of the organizations implementing the quality assurance program, regularly assess the adequacy of the program and assure its effective implementation?	BR-2			
3.0	<u>Design Control</u>				
3.1	Does the supplier's program require that:				
3.1.1	designs be defined, controlled, and verified,	BR-3			
3.1.2	applicable design inputs be appropriately specified on a timely basis, and translated into design documents,	BR-3			
3.1.3	design interfaces be identified and controlled,	BR-3			
3.1.4	design adequacy be verified by persons other than those who designed the item,	BR-3			
3.1.5	design changes, including field changes be governed by control measures commensurate with those applied to the original design?	BR-3			
3.2	Do the responsible design organizations identify, document review, and approve applicable design inputs, such as design bases, performance requirements, regulatory requirements, codes, and standards?	BR-3			
4.0	<u>Procurement Document Control</u>				
4.1	Are applicable design bases and other requirements necessary to assure adequate quality, included or referenced in procurement documents?	BR-4			
5.0	<u>Instructions, Procedures, and Drawings</u>				
5.1	Are the activities affecting quality prescribed by, and performed in accordance with documented instructions, procedures, and drawings?	BR-5			
5.2	Do such documents include, or reference appropriate quantitative and qualitative acceptance criteria for determining that prescribed activities are accomplished?	BR-5			
6.0	<u>Document Control</u>				
6.1	Does the supplier's program provide for the control of documents that specify quality requirements, or prescribe activities affecting quality, to assure that correct documents are being utilized?	BR-6			
6.1.1	Are such documents, including revisions, reviewed for adequacy and approved by authorized personnel?				

NQA-1 Basic Requirements Checklist		Ref.	Yes	No	Notes
7.0	<u>Control of Purchased Items and Services</u>				
7.1	Is the procurement of items and services controlled to assure conformance with specified requirements, and do the controls provide for:	BR-7			
7.1.1	source evaluation and selection,				
7.1.2	evaluation of objective evidence of quality furnished by the supplier,				
7.1.3	source inspection, audit, and				
7.1.4	examination of items and services upon delivery or completion?				
8.0	<u>Identification and Control of Items</u>				
8.1	Are identification and control measures established to assure that only correct and accepted items are utilized?	BR-8			
8.2	Has identification been maintained either on the items or in documents traceable to the items?	BR-8			
9.0	<u>Control of Processes</u>				
9.1	Are the processes that affect the quality of items or services controlled?	BR-9			
9.2	Are the special processes that control or verify quality, such as those used in welding, heat treating, and nondestructive examination, performed by qualified personnel using qualified procedures?	BR-9			
10.0	<u>Inspection</u>				
10.1	Are inspections that verify conformance BR-1 to requirements planned and executed?	BR-10			
10.2	Are the characteristics to be inspected, and the inspection methods employed specified?	BR-10			
10.3	Are the inspection results documented?	BR-10			
10.4	Have the inspections for acceptance been performed by persons other than those who performed or directly supervised the work being inspected?	BR-10			
11.0	<u>Test Control</u>				
11.1	Are test control measures that verify conformance of an item to specified requirements, and demonstrate that items will perform satisfactorily, planned, reviewed, and implemented?	BR-11			
11.2	Are the characteristics to be tested and test methods to be utilized, specified?	BR-11			
11.3	Are test results documented, and their conformance with acceptance criteria evaluated?	BR-11			

NQA-1 Basic Requirements Checklist		Ref.	Yes	No	Notes
12.0	<u>Control of Measuring and Test Equipment</u>				
12.1	Are tools, gauges, instruments, and other measuring and test equipment used for activities affecting quality controlled, and at specified periods calibrated and adjusted to maintain accuracy within required limits?	BR-12			
13.0	<u>Handling, Storage, and Shipping</u>				
13.1	Does the supplier have the necessary measures to assure that handling, storage, cleaning, packaging, shipping, and preservation of items is controlled to prevent damage or loss and to minimize deterioration?	BR-13			
13.2	Is the handling, storage, and shipping of items conducted in accordance with, established work and inspection instruction, drawing, specification, shipping instructions, or other pertinent documents or procedures?	BR-13			
14.0	<u>Inspection, Test, and Operating Status</u>				
14.1	The status of inspection and test activities shall be identified either on the items or in documents traceable to the items?	BR-14			
14.2	Where it is necessary to assure that required inspections and tests are performed, and to assure that items which have not passed the required inspections and tests are not inadvertently installed, used, or operated, the status shall be maintained through indicators, such as physical location and tags, markings, shop travelers, stamps, inspection records, or other suitable means?	BR-14			
14.3	Has the authority of application and removal of tags, markings, labels, and stamps been documented?	BR-14			
15.0	<u>Control of Nonconforming Items</u>				
15.1	Are the items that do not conform to specified requirements controlled to prevent inadvertent installation or use, and do such controls provide for:	BR-15			
15.1.1	identification,				
15.1.2	documentation,				
15.1.3	evaluation,				
15.1.4	segregation (when practical),				
15.1.5	disposition of nonconforming items, and notification to affected organizations?				
16.0	<u>Corrective Action</u>				
16.1	Does the supplier's program provide that:	BR-16			
16.1.1	conditions adverse to quality shall be identified promptly and corrected as soon as practical to preclude repetition,				

NQA-1 Basic Requirements Checklist		Ref.	Yes	No	Notes
16.1.2	in the case of a significant condition adverse to quality, the cause of the condition shall be determined and corrective action taken to preclude recurrence,				
	the identification, cause, and corrective action for significant conditions adverse to quality have been documented and reported to appropriate levels of management.				
	follow-up action shall be taken to verify implementation of corrective action?				
17.0	<u>Quality Assurance Records</u>				
17.1	Does the supplier's program provide:	BR-17			
17.1.1	records that furnish documentary evidence of quality be specified, prepared, and maintained,				
17.1.2	records that are legible, identifiable, and retrievable,				
17.1.3	records be protected against damage, deterioration, or loss,				
17.1.4	requirements and responsibilities for record transmittal, distribution, retention, maintenance, and disposition be established and documented?				
17.2	Is the records system defined, implemented, and enforced in accordance with written procedures, instruction, or other documentation?	BR-17			
18.0	<u>Audits</u>				
18.1	Does the supplier's system provide for planned and scheduled audits to verify compliance with all aspects of the quality assurance program and determine its effectiveness?	BR-18			
18.2	Does the supplier's system provide that the audits will be performed with written procedures or checklists and by personnel who do not have direct responsibility for performing the activity?	BR-18			
18.3	Does the supplier's system state that the audit results will be documented, reported to, and reviewed by responsible management?	BR-18			
18.4	Does the supplier's system provide that follow-up action be taken where indicated?	BR-18			
NOTES:
