Summary

This document presents the climatological data measured at the U.S. Department of Energy's Hanford Site for calendar year 1998. Pacific Northwest National Laboratory¹ operates the Hanford Meteorology Station and the Hanford Meteorological Monitoring Network from which these data were collected. The information contained herein includes updated historical climatologies for temperature, precipitation, normal and extreme values of temperature and precipitation, and other miscellaneous meteorological parameters. Further, the data are adjunct to and update Hoitink and Burk (1994, 1995, 1996, 1997, 1998); however, Appendix B—Wind Climatology (1994) is excluded.

1998 was much warmer than normal, tying 1992 as the warmest year on record. The average temperature was 56.4°F, 3.1°F above normal (53.3°F). The highest July temperature ever recorded was 112°F on July 27, 1998. The first week in May, three daily temperature records were broken or tied. November 1998 was the third warmest on record. For the year 1998, there were 73 days with maximum temperature $\geq 90^\circ\text{F}$, the third highest on record. For the 12-month period, 11 months were warmer than normal and 1 was cooler than normal. The summer (June, July, and August) and autumn (September, October, and November) of 1998 were the fourth warmest on record.

1998 was slightly wetter than normal. Precipitation totaled 6.45 in., 103% of normal (6.26 in.); snowfall totaled 7.2 in., compared to the normal of 13.8 in. There were eight thunderstorms recorded at Hanford Meteorological Station in July 1998, tying 1983 for the most thunderstorms in July.

The average wind speed during 1998 was 7.9 mph, 0.2 mph above normal (7.7 mph). There were 32 days with peak gusts ≥ 40 mph, compared to a yearly average of 26 mph. The peak gust during the year was 56 mph from the south-southwest on November 21. November 1998 had a record number of days (10) with wind gusts ≥ 40 mph.

The heating-degree days for 1997-1998 were 4,523 (14% below the 5,231 normal). Cooling-degree days for 1998 were 1,377 (38% above the 994 normal).

For inquiries regarding this report, contact Mr. D. J. Hoitink at Pacific Northwest National Laboratory, P.O. Box 999, Richland, Washington 99352, or by electronic mail at dana.j.hoitink@pnl.gov.

¹ Pacific Northwest National Laboratory is operated by Battelle for the U.S. Department of Energy.

Acknowledgments

The authors wish to acknowledge Dana Ward, the Department of Energy Richland Operations Office Technical Monitor for the Meteorological and Climatological Services Project, for his continued strong support.

Notes on Units of Measure

This document mainly uses English units (e.g., miles per hour [mph], inches [in.], degrees Fahrenheit [°F]) when presenting all information. This decision to use English units was based on the fact that English units are still the standard in National Oceanic and Atmospheric Administration (specifically, the National Climatic Data Center and National Weather Service) reporting and publications.

Throughout this document the term "normal" is used to indicate climatological normal, defined as an average value over a period of years of any meteorological element such as temperature, pressure, and rainfall. The accepted convention uses a 30-year time period, ending with the first year of each new decade (such as 1951-1980, 1961-1990, 1971-2000). The current time period used for climatological normals is 1961-1990.

Some useful conversions between English units and metric equivalents are:

1 foot (ft) = 0.3048 meter (m)

1 mile (mi) = 1.609 kilometers (km)

1 inch (in.) = 2.54 centimeters (cm)

1 mile per hour (mph) = 0.447 meter/second (m/s)

degrees Fahrenheit (°F) = $(9/5 \times ^\circ\text{C}) + 32$

degrees Celsius (°C) = $5/9 \times (^\circ\text{F} - 32)$.

1.0 Introduction

The U.S. Department of Energy's Hanford Site lies within the semiarid shrub-steppe Pasco Basin of the Columbia Plateau in southeastern Washington state. The Hanford Site occupies an area of ~560 mi² north of the confluence of the Snake and Yakima Rivers with the Columbia River. The Columbia River flows through the northern part of the Hanford Site and, turning south, forms part of the site's eastern boundary. The Yakima River runs along part of the southern boundary and joins the Columbia River below the city of Richland, which bounds the Hanford Site on the southeast. Rattlesnake Mountain, Yakima Ridge, and Umtanum Ridge form the southwestern and western boundaries. The Saddle Mountains form the northern boundary of the Hanford Site.

The Cascade Range, beyond Yakima to the west, greatly influences the climate of the Hanford Site area by means of its rain shadow effect. This mountain range also serves as a source of cold air drainage, which has a considerable effect on the wind regime on the Hanford Site. The regional temperatures, precipitation, and winds are greatly affected by the presence of mountain barriers. The Rocky Mountains and ranges in southern British Columbia are effective in protecting the inland basin from the more severe winter storms and associated cold polar air masses moving southward across Canada.

This document presents the calendar year 1998 climatological data summary for the Hanford Meteorology Station (HMS) and additional climatologies for temperature, wind, precipitation, and other meteorological parameters for the HMS and the automated stations of the Hanford Meteorological Monitoring Network (HMMN). Climatological normal and extreme values for temperature and precipitation are also presented. Currently, 30 monitoring stations are within and located near the U.S. Department of Energy's Hanford Site (Table 1.1, Figure 1.1). A detailed description of each of the monitoring stations, including photographs of the topography surrounding each site, is provided in Glantz and Islam (1988).

Operation of the HMS is a function of the Meteorological and Climatological Services Project funded by the U.S. Department of Energy. This project, managed by the Pacific Northwest National Laboratory, is responsible for providing the U.S. Department of Energy and Hanford Site contractors ongoing meteorological and climatological services support, primarily for emergency response activities, Hanford Site work scheduling, and general site safety. Detailed, real-time meteorological data are needed in the event of a release of hazardous material to the atmosphere from any of the Hanford Site facilities. These data can be used to model atmospheric dispersion and to estimate the environmental impacts of the release. Meteorological data and weather forecasts are also necessary to ensure that operations and activities on the Hanford Site are conducted safely, particularly where specific weather conditions might impact those operations or activities. The climatological database is also used in environmental studies, environmental impact reports, facility design, and planning operations.

During the period April 1912 through March 1943, cooperative observers for the U.S. Weather Bureau (now the National Weather Service) recorded daily maximum and minimum temperatures and precipitation, including measurements of unmelted snow at the Old Hanford Townsite ~10 mi east-northeast of the present HMS. From late 1943 until mid 1944, the U.S. Weather Bureau recorded some

meteorological operations in Richland. Then, in 1944 as part of the Manhattan Project, the HMS was established. Hourly observations began on December 7, 1944.

The HMS and its 410-ft instrument tower are located near the center of the Hanford Site between the 200-West and 200-East Areas (see Figure 1.1). Hourly observations of wind direction, wind speed, and air temperature are made at multiple levels on the 410-ft tower. Throughout this document, wind measurements from the HMS are made at the 50-ft level and temperature measurements are made at the 3-ft level. A variety of other meteorological parameters are also measured or observed, including current

Figure 1.1. Map of the Hanford Site and Surrounding Areas

weather, dew point temperature, relative humidity, precipitation, atmospheric pressure, cloud cover, visibility, and solar radiation. Several climatological summaries of data collected at the HMS, at the Old Hanford Townsite, and Richland monitoring locations were published over the past 30 years (Jenne and Kerns 1959; Stone et al. 1972, 1983; Hoitink and Burk 1994, 1995, 1996, 1997, 1998).

This document is composed of the following information. The 1998 calendar year summary of climatological data for the Hanford Site is contained in Section 2.0. Temperature, precipitation, wind, and miscellaneous climatological statistics are contained in Sections 3.0 through 6.0, respectively. Section 8.0 lists the references cited in the document, and Section 9.0 provides a bibliography of database, computer code, and other pertinent reports. The appendix gives the station-specific wind roses and joint frequency distributions for 1998.

2.0 Calendar Year 1998 Summary

Calendar year 1998 was much warmer than normal, tying 1992 as the warmest year on record. The average temperature was 56.4°F, 3.1° above normal (53.3°F). The coldest year on record is 1985, which averaged 49.6°F.

Eleven months during 1998 were warmer than normal, 7 of which were at least 2.5°F above normal. Only October was cooler than normal, and only by 0.5°F. July had the greatest positive departure (5.8°F).

1998 was only slightly wetter than normal. Precipitation totaled 6.45 in., 103% of normal (6.26 in.). The wettest year was 1995 with 12.31 in.; the driest was 1976 with only 2.99 in. Calendar year snowfall totaled 7.2 in., compared to an annual normal of 13.8. The greatest calendar year snowfall was 57.5 in. (1996).

January 1998 was much warmer than normal, averaging 36.2°F, 4.9° above normal (31.3°F). Except for a four-day cold spell from January 10-13, which included a minimum temperature of 7°F on January 13, the rest of the month was considerably warmer than normal. The warmest January averaged 42.5°F (1953); while the coldest averaged 12.1°F (1950).

Precipitation for January 1998 totaled 1.24 in., 157% of normal (0.79 in.). The wettest January, in 1970, received 2.47 in.; while the driest, in 1977, received 0.08 in. Snowfall for January 1998 totaled 6.3 in., compared to a January normal of 3.9 in. The snowiest January, in 1950, received 23.4 in., while January 1994 received no snowfall.

January 1998's average wind speed was 7.8 miles per hour (mph), compared to a January normal of 6.5 mph. The peak wind gust for the month was 43 mph recorded on January 24. There were 5 days in January 1998 with peak gusts ≥ 40 mph, compared to a normal of 3 mph and a high of 11 mph (in 1990 and 1972). The highest wind gust ever recorded during January was 80 mph in 1972. The windiest January averaged 10.3 mph (1972); while the January with the lightest winds (1985) averaged 2.9 mph.

February 1998 was much warmer than normal, averaging 42.2°F, 4.2° above normal (38.0°F). Only six days during the month had average temperatures below normal. The warmest February averaged 44.5°F (1958 and 1991); while the coldest averaged 25.6°F (1956).

Precipitation for February 1998 totaled 1.15 in., 186% of normal (0.62 in.). The wettest February, in 1961, received 2.10 in.; while the driest, in 1967 and 1988, received only a trace. Only a trace of snowfall was recorded in February 1998, compared to a normal of 2.0 in. The snowiest February, in 1989, received 17.0 in., while numerous Februaries (as recently as 1991) received no snowfall.

February 1998's average wind speed was 7.3 mph, compared to a February normal of 7.2 mph. The peak wind gust for the month was 50 mph recorded on February 21. The record wind gust for February was 65 mph in 1971. The windiest February averaged 10.8 mph (1976); while the February with the lightest winds (1963) averaged 4.6 mph.

The winter season of 1997-1998 (December, January and February) was much warmer than normal, averaging 37.7°F, 4.1°F above normal (33.6°F). The warmest winter on record (1966-1967) averaged 40.6°F, while the coldest (1948-1949) averaged only 24.2°F. The coldest temperature for the winter was 7°F on January 13.

Precipitation for the 1997-1998 winter season totaled 2.70 in., 111% of normal (2.44 in.). The wettest winter season (1996-1997) received 5.45 in., while the driest (1946-1947) received only 0.70 in. Total snowfall for the 1997-1998 winter season totaled 8.1 in., compared to a normal through February of 13.5 in. The snowiest winter on record (1992-1993) received 56.1 in., while the winter with the least snow (1957-1958) received only 0.3 in.

March 1998 was warmer than normal, averaging 48.4°F, 2.8° above normal (45.6°F). The warmest March averaged 51.5°F (1992); while the coolest averaged 39.4°F (1955).

Precipitation for March 1998 totaled 0.50 in., 106% of normal (0.47 in.). The wettest March, in 1957, received 1.86 in.; while the driest, in 1968, received 0.02 in. A trace of snowfall was recorded in March 1998, compared to a normal of 0.3 in. The snowiest March, in 1951, received 4.2 in., while numerous Marches (as recently as 1995) received no snowfall.

March 1998's average wind speed was 7.3 mph, compared to a March normal of 8.3 mph. The peak gust for the month was 39 mph recorded on March 16 and 26. The record gust for March was 70 mph in 1956. The windiest March averaged 10.7 mph (1977); while the March with the lightest winds (1958) averaged 5.9 mph.

April 1998 was warmer than normal, averaging 54.4°F, 1.7° above normal (52.4°F). The warmest April averaged 58.2°F (1994); while the coolest averaged 47.5°F (1955).

Precipitation for April 1998 totaled only 0.07 in., 17% of normal (0.41 in.). The wettest April, in 1995, received 1.54 in.; while the driest, in 1986, received only a trace.

April 1998's average wind speed was 7.6 mph, compared to an April normal of 9.0 mph. The peak wind gust for the month was 37 mph recorded on April 24. The record wind gust for April was 73 mph in 1972. The windiest April averaged 11.1 mph (1972); while the April with the lightest winds (1989) averaged 7.4 mph.

May 1998 was warmer than normal, averaging 62.4°F, 1.1° above normal (61.3°F). The first week of the month averaged 14° above normal, with three daily temperature records broken or tied. May was the tenth consecutive month with above normal average temperatures, dating back to August 1997. The warmest May averaged 68.7°F (1947); while the coolest averaged 56.0°F (1984).

Precipitation for May 1998 totaled 0.52 in., 102% of normal (0.51 in.). The wettest May, in 1972, received 2.03 in.; while the driest, in 1992, received only a trace.

May 1998's average wind speed was 8.0 mph, compared to a May normal of 8.8 mph. The peak wind gust for the month was 55 mph recorded on May 21. The record wind gust for May was 71 mph in 1948. The windiest May averaged 10.7 mph (1983); while the May with the lightest winds (1957) averaged 5.8 mph.

Spring 1998 (March, April, and May) was warmer than normal, averaging 55.1°F, 1.9°F above normal (53.2°F). The warmest spring, in 1992, averaged 58.2°F, while the coolest spring, in 1955, averaged 48.0°F.

Precipitation for the spring season totaled 1.09 in., 78% of normal (1.40 in.). The wettest spring, in 1995, received 3.28 in., while the driest, in 1968, received only 0.09 in. Only a trace of snowfall was recorded during the period.

June 1998 was warmer than normal, averaging 71.0°F, 1.3° above normal (69.7°F). There were 7 days in June with maximum temperatures $\geq 90^{\circ}\text{F}$ (normal for June is 9 days). There were no days with maximum temperatures $\geq 100^{\circ}\text{F}$ (normal are 2). The warmest June averaged 76.8°F (1992); while the coolest averaged 63.0°F (1953).

Precipitation for June 1998 totaled 0.48 in., 126% of normal (0.38 in.). The wettest June, in 1950, received 2.92 in.; while the driest, in 1986 and 1979, received only a trace.

June 1998's average wind speed was 9.8 mph, compared to a June normal of 9.1 mph. The peak wind gust for the month was 50 mph recorded on June 15. The record wind gust for June was 72 mph in 1957. The windiest June averaged 10.7 mph (1983); while the June with the lightest winds (1950) averaged 7.7 mph.

July 1998 was much warmer than normal, averaging 82.0°F, 5.8° above normal (76.2°F), and was the second warmest July (and also the second warmest month) on record. The warmest month ever was July 1985 which averaged 82.2°F. The coolest July was 70.5°F in 1993. There were 26 days in July with maximum temperatures $\geq 90^{\circ}\text{F}$ (normal for July is 19 days), and there were 14 days with maximum temperatures $\geq 100^{\circ}\text{F}$ (normal is 6). The maximum temperature of 112°F on July 27 was the highest temperature ever recorded in the month of July (the previous highest was 111°F on July 22, 1994 and July 31, 1971). This was also the hottest temperature at the HMS since 112°F was recorded on August 9, 1971. The minimum temperature of 81°F on July 28 was the second highest minimum temperature ever recorded, the highest was 82°F on July 23, 1994.

Precipitation for July 1998 totaled 0.34 in., 189% of normal (0.18 in.). While the HMS received only 0.16 in. of rain on Friday, July 31, a monitoring station on the north slope of Rattlesnake Mountain reported 1.03 in., and the monitoring station in the 300 Area received 0.65 in. The wettest July, in 1993, received 1.76 in.; while the driest, in 1980 and earlier years, received only a trace. There were eight thunderstorms recorded at the HMS in July 1998, tying 1983 for the most thunderstorms in July.

July 1998's average wind speed was 8.1 mph, compared to a July normal of 8.8 mph. The peak wind gust for the month was 47 mph recorded on July 27. The record wind gust for July was 69 mph in 1979. The windiest July averaged 10.7 mph (1983); while the July with the lightest winds (1955) averaged

6.8 mph. During the thunderstorm of Friday evening, July 10, meteorological monitoring stations at Pasco and Vista Field in Kennewick recorded peak wind gusts of 68 and 66 mph, respectively.

August 1998 was warmer than normal, averaging 77.9°F, 2.8° above normal (75.1°F). The warmest August occurred in 1967 and averaged 81.5°F. The coolest August was 69.8°F in 1964. There were 24 days in August with maximum temperatures $\geq 90^\circ\text{F}$ (normal for August is 16 days), and there were 9 days with maximum temperatures $\geq 100^\circ\text{F}$ (normal is 5).

Precipitation for August 1998 totaled only 0.04 in., 15% of normal (0.27 in.). The wettest August, in 1977, received 1.36 in., while the driest, in 1988, recorded no precipitation.

August 1998's average wind speed was 8.1 mph, compared to an August normal of 7.9 mph. The peak wind gust for the month was 50 mph recorded on August 15. The record wind gust for August was 66 mph in 1961. The windiest August averaged 9.5 mph (1996); while the August with the lightest winds (1956) averaged 6.0 mph.

The summer of 1998 (June, July, and August) was the fourth warmest on record, averaging 77.0°F, 3.3° above normal (73.7°F). The warmest summer, in 1958, averaged 78.2°F, while the coolest, in 1980, averaged 70.2°F. The hottest maximum temperature of the summer was 112°F on July 27, while the coolest minimum was 47°F on June 27.

Precipitation for the summer of 1998 totaled 0.86 in., 104 percent of normal (0.83 in.). The wettest summer occurred in 1950 when 2.99 in. of precipitation was recorded, while the driest summer (1973) received only 0.03 in.

September 1998 was much warmer than normal, averaging 71.0°F, 5.3° above normal (65.7°F), and the fourth warmest on record. The warmest September occurred in 1990 and averaged 72.4°F. The coolest September was 58.8°F in 1985. September 1998 was the fourteenth consecutive month that averaged above normal. There were 12 days in September with maximum temperatures $\geq 90^\circ\text{F}$ (normal for September is 5 days), and there were 3 days with maximum temperatures $\geq 100^\circ\text{F}$ (normal is 0 days). For the year, there were 73 days (the third highest on record) with maximum temperatures $\geq 90^\circ\text{F}$ (normal is 52 days). The most 90° days were 79 in 1967 and the least were 29 days in 1980. There were 26 days (also the third highest on record) in 1998 with maximum temperatures $\geq 100^\circ\text{F}$ (normal is 13 days). The most 100°F days were 28 in 1958 and the least was one day in 1954.

Precipitation for September 1998 totaled only 0.10 in., 32% of normal (0.31 in.). The wettest September, in 1947, received 1.34 in., while the driest, in 1991, recorded no precipitation.

September 1998's average wind speed was 6.7 mph, compared to a September normal of 7.4 mph. The peak wind gust for the month was 35 mph recorded on September 17. The record wind gust for September was 65 mph in 1953. The windiest September averaged 9.2 mph (1961); while the September with the lightest winds (1957) averaged 5.4 mph.

October 1998 was slightly cooler than normal, averaging 52.4°F, 0.5° below normal (52.9°F). The warmest October occurred in 1988 and averaged 59.6°F. The coolest October was 47.9°F in 1984.

Precipitation for October 1998 totaled 0.28 in., 74% of normal (0.38 in.). The wettest October, in 1957, received 2.72 in., while the driest, in 1987 and earlier years, received only a trace of precipitation.

October 1998's average wind speed was 7.0 mph, compared to an October normal of 6.5 mph. The peak wind gust for the month was 46 mph recorded on October 8. The record wind gust for October was 72 mph in 1997. The windiest October averaged 9.1 mph (1946); while the October with the lightest winds (1952) averaged 4.4 mph.

November 1998 was much warmer than normal, averaging 45.6°F, 5.4° above normal (40.2°F), and was the third warmest November on record. The warmest November occurred in 1990 and averaged 46.5°F, while the coldest was 24.8°F in 1985.

Precipitation for November 1998 totaled 1.29 in., 142% of normal (0.91 in.). The wettest November, in 1996, received 2.67 in., while the driest, in 1976, received only a trace. There was no snowfall recorded in November 1998, compared to a November normal of 1.8 in.

November 1998 was a very windy month with an average wind speed of 8.8 mph, compared to a November normal of 6.4 mph. For the period from November 20 through 26, the average wind speed was 16.2 mph, and every day during the period had gusts in excess of 40 mph. The peak wind gust for the month was 56 mph recorded on November 21. There were a record number of days (10) in November 1998 with wind gusts ≥ 40 mph. The previous record was 8 days in 1990 (normal is 2 days). There were 4 days during the month with wind gusts ≥ 50 , tying the record of 4 days, also recorded in November 1990. The record wind gust for November was 67 mph in 1993. The windiest November averaged 10.0 mph (1990); while the November with the lightest winds (1956) averaged 2.9 mph.

Autumn 1998 (September, October, and November) was much warmer than normal, averaging 56.3°F, 3.4° above normal (52.9°F), and was the fourth warmest autumn on record. The warmest was 57.1°F in 1990, while the coolest was 44.5°F in 1985.

Autumn 1998 precipitation totaled 1.67 in., 104% of normal (1.60 in.). The wettest autumn received 4.79 in. (1973), while the driest received only 0.04 in. (1976).

December 1998 was warmer than normal, averaging 33.0°F, 1.6° above normal (31.4°F). The warmest December occurred in 1957 and averaged 38.5°F, while the coldest was 21.0°F in 1985. The minimum temperature of -1°F on December 21 was the coldest temperature in nearly two years.

Precipitation for December 1998 totaled 0.44 in., 43% of normal (1.03 in.). The wettest December, in 1996, received 3.69 in., while the driest, in 1976, received 0.11 in. There was 0.9 in. of snowfall recorded in December 1998, compared to a December normal of 5.7 in. The snowiest December received 22.6 in. (1996), while December 1957 and 1963 received only a trace.

The average wind speed for December 1998 was 7.8 mph compared to a December normal of 5.9 mph. The peak wind gust for the month (at the HMS) was 55 mph recorded on December 26. Monitoring stations in Richland recorded gusts of 67 and 70 mph on December 27. The record wind gust for

December was 71 mph in 1955. The windiest December averaged 8.3 mph (1968); while the December with the lightest winds (1985) averaged 3.3 mph.

The following are some additional statistics for 1998:

Category	Number of days	Normal	Record	
			Maximum	Minimum
Maximum temperatures $\geq 100^{\circ}\text{F}$	26	13	28	1
Maximum temperatures $\geq 90^{\circ}\text{F}$	73	52	79	29
Maximum temperatures $\leq 32^{\circ}\text{F}$	12	24	58	2
Minimum temperatures $\geq 70^{\circ}\text{F}$	8	7	21	0
Minimum temperatures $\leq 32^{\circ}\text{F}$	85	107	139	77
Minimum temperatures $\leq 0^{\circ}\text{F}$	1	3	18	0
Thunderstorms	14	10	23	3
Fog (visibility ≤ 6 mi)	46	45	76	22
Dense fog (visibility ≤ 0.25 mi)	23	24	42	9
Peak wind gusts ≤ 12 mph	41	50	87	28
Peak wind gusts ≥ 25 mph	152	155	190	123
Peak wind gusts ≥ 40 mph	32	26	57	10
Peak wind gusts ≥ 50 mph	10	5	18	0

Table 2.1 lists the daily temperature records for 1998 along with the previous record and year of occurrence. Table 2.2 lists the monthly and annual totals for numerous meteorological parameters for 1998. Table 2.3 lists the 1998 monthly and seasonal temperature and precipitation compared to normals and extremes. Tables 2.4, 2.5, and 2.6 list the 1998 monthly and annual average temperature, precipitation, and wind speed, respectively, from the HMMN.

Figures 2.1 and 2.2 give a composite of the wind roses (at the 10- and 60-m levels, respectively) from the HMMN for 1998. The appendix gives the individual 1998 wind roses from the HMMN stations.

Figure 2.3 depicts the 1998 observed daily maximum and minimum temperatures and the normal maximum, minimum, and mean daily temperatures for the HMS.

Daily Temperatures - 1998 Hanford Meteorological Station

Figure 2.3. 1998 Observed Daily Temperatures from the Hanford Meteorology Station

3.0 Temperature Climatology

3.1 Monthly, Seasonal, and Annual Average

Monthly, seasonal, and annual average temperatures, computed from observed daily maximum and minimum temperatures for the period 1945 through 1998, are presented in Tables 3.1 and 3.2. In these tables, the highest and lowest values, representing the warmest and coldest month, season, or year, are noted. Averages are based on the entire period of record, and climatological normal temperatures are based on the period 1961 through 1990.

As indicated in Table 3.1, much wider ranges and variabilities in temperatures are found during the late autumn and winter months (November through February) than during the rest of the year. The range of average monthly temperatures for January is from 12.1°F (1950) to 42.5°F (1953), 30.4°F; for November 21.7°F; February 18.9°F; and December 17.5°F; whereas for the rest of the year, the monthly range is from a low of 10.5°F in April to a high of 13.8°F in June. The coldest month recorded was January 1950 (12.1°F); the hottest month recorded was July 1985 (82.2°F). As shown in Table 3.2, the seasonal range is from 8.0°F during the summer (June, July, and August) to 16.4°F in winter (December, January, and February). The coldest season was the winter of 1948-1949 (24.2°F); the hottest was the summer of 1958 (78.2°F).

3.2 Days with Maximum Temperatures $\geq 100^{\circ}\text{F}$, $\geq 90^{\circ}\text{F}$, and $\leq 32^{\circ}\text{F}$

Table 3.3 contains the number of days each year with maximum temperatures in the categories $\geq 100^{\circ}\text{F}$, $\geq 90^{\circ}\text{F}$, and $\leq 32^{\circ}\text{F}$.

Maximum temperatures $\geq 100^{\circ}\text{F}$ occurred as early as May 5 (1966) and as late as September 6 (1955). The annual number of days with maximum temperatures in this category ranged from 1 to 28 (1954 and 1958, respectively). The greatest number of consecutive days with maximum temperatures $\geq 100^{\circ}\text{F}$ is 11 and occurred 3 times: July 22 through August 1, 1962; August 10 through 20, 1967; and August 6 through 16, 1981.

One particularly notable period of above-normal temperatures occurred July 15 through August 13, 1971. This 30-day period included 27 days with maximum temperatures $\geq 100^{\circ}\text{F}$ in 3 separate periods of 9 consecutive days each. The lowest maximum temperature during the 30-day period was 98°F; the highest was 112°F. The average maximum temperature during this period was 104.7°F.

Table 3.4 lists the dates of all occurrences of maximum temperatures $\geq 104^{\circ}\text{F}$.

Maximum temperatures $\geq 90^{\circ}\text{F}$ occur an average of 52 times per year and vary from a low of 29°F (1980) to a high of 79°F (1967). The earliest occurrences varied from April 24 (1977) through July 2 (1953), with an average annual date of May 21 (Table 3.5). The latest annual occurrence of maximum temperatures $\geq 90^{\circ}\text{F}$ varied from August 17 (1983) through September 29 (1993 and earlier years). The average date for the period 1946 through 1996 is September 15. The longest period of consecutive maximum temperatures $\geq 90^{\circ}\text{F}$ is 32 days from July 13 through August 13, 1971.

The average seasonal number of days with maximum temperatures $\leq 32^{\circ}\text{F}$ is 24. The earliest seasonal occurrence of a day with a maximum temperature $\leq 32^{\circ}\text{F}$ was October 30 (1971) and the latest was March 11 (1950). The number of winter days with maximum temperatures $\leq 32^{\circ}\text{F}$ varied from

Table 3.5. Record of Annual First and Last Dates with Maximum Temperatures $\geq 90^{\circ}\text{F}$ and Minimum Temperatures $\leq 32^{\circ}\text{F}$

(a) Days between last freezing temperature in spring and first freezing temperature in autumn.

(b) Earliest and latest dates.

(c) Also in previous years.

2 to 58 days (winters of 1966-1967 and 1984-1985, respectively). The greatest consecutive number of days with maximum temperatures $\leq 32^{\circ}\text{F}$ is 29 days, from December 30, 1984 through January 27, 1985. During the period December 27, 1978 through February 4, 1979 (40 days), only 1 maximum temperature $> 32^{\circ}\text{F}$ occurred. The average maximum temperature for that period was 21°F .

Table 3.6 lists the monthly and annual maximum temperatures. Only 6 days were recorded when the daily maximum temperature was $\leq 0^{\circ}\text{F}$. These were:

Maximum Date	Temperature
January 31, 1950	-2°F
February 1, 1950	-3°F
February 2, 1950	-3°F
January 27, 1957	0°F
December 29, 1968	-2°F
December 30, 1968	-2°F

3.3 Days with Minimum Temperatures $\leq 32^{\circ}\text{F}$ or $\leq 0^{\circ}\text{F}$

The monthly and seasonal number of days with minimum temperatures at or below 32°F or 0°F are listed in Table 3.7.

The seasonal average number of days with minimum temperatures $\leq 32^{\circ}\text{F}$ is 106; however, the number ranges from 70 to 143 days (winters of 1991-1992 and 1984-1985, respectively). The greatest consecutive number of days with minimum temperatures of $\leq 32^{\circ}\text{F}$ is 93, from November 9, 1978 through February 9, 1979.

The first autumn temperature $\leq 32^{\circ}\text{F}$ occurred as early as September 25 (1972) and as late as November 12 (1962). The average date is October 20 (see Table 3.5). The last date in spring for minimum temperatures $\leq 32^{\circ}\text{F}$ varied from March 19 (1958) to May 16 (1974), with an average date of April 19. The average number of days between last freezing temperature in the spring and first freezing temperature in the autumn is 183 days.

On average, 3 days per winter season have a minimum temperature $\leq 0^{\circ}\text{F}$; however, nearly half of all winters have no minimum temperatures in this category (see Table 3.7). The most of those days in any season was 18 (winter of 1949-1950) and the least of those days was 0 (as recently as the winter of 1997-1998). The greatest number of consecutive days with minimum temperatures $\leq 0^{\circ}\text{F}$ is 11 days, from January 25 through February 4, 1950. During this same period, 4 consecutive days had minimum temperatures $\leq -20^{\circ}\text{F}$. Table 3.8 lists all days with minimum temperatures $\leq 0^{\circ}\text{F}$. Table 3.9 lists monthly and annual minimum temperatures.

3.4 Monthly Extreme Daily Maximum and Minimum Temperatures

Monthly extreme daily maximum and minimum temperatures are presented in Table 3.10. Note that a greater temperature range exists during the winter than in the summer. February temperatures ranged from 72°F to -23°F, a range of 95°F. July temperatures ranged from 112°F to 39°F, a range of 83°F.

3.5 Average Daily Temperature Range

Table 3.11 represents the average daily temperature range by month and year for the period 1945 through 1998. This statistic is compiled by determining each daily temperature range (the difference between the maximum and minimum temperature), totaling for every day of the month, and dividing by the number of days in the month. As can be seen from the table, the average daily temperature ranges for July and August (>30°F) are more than double the ranges for December and January (<15°F). The lowest average daily temperature range was 8.0°F in December 1985; the greatest was 34.5°F in August 1967. The greatest range for any single day was 48°F on August 14, 1995 (high of 93°F, low of 45°F) and also on May 11, 1946 (high of 86°F, low of 38°F). The least range for any single day was 1°F as recently as December 6, 1997 (high of 30°F, low of 29°F).

3.6 Normal and Extreme Daily Temperatures

Table 3.12 lists the normal and extreme daily maximum and minimum temperatures. Climatological normals are computed every 10 years and are based on a 30-year period, ending with the first year of each new decade. The current normal period is 1961 through 1990; the next will be 1971 through 2000. The normal temperatures in Table 3.12 are computed using a 7-day running mean, centered about each day.

Four possible temperature extremes are presented for each day, a record high and low maximum and a record high and low minimum. These daily records, plus the year of occurrence for the period 1945 through 1998, are also indicated in Table 3.12.

3.7 Subsurface Soil Temperatures

Hourly subsurface soil temperature data at depths of ~0.5 in., 15 in., and 36 in. are available for the period from 1955 through 1998. The subsurface soil temperature sensors are installed in the natural soil of the area with the vegetation cover removed. The soil is sandy and mixed with large gravel.

Monthly averages and extremes of monthly averages are presented in Table 3.13. The absolute hourly extremes are also indicated in that table.

Table 3.10. Monthly Normal Temperatures (°F) and Monthly Extremes of Maximum and Minimum Temperatures (°F)

3.8 Heating- and Cooling-Degree Days

Heating- and cooling-degree day data are generally used by the utility industry and those involved in building design to assess heating and cooling energy requirements. A temperature of 65°F is generally used as the basis for this calculation. To determine whether a day has either heating-degree days (HDDs) or cooling-degree days (CDDs), 65 is subtracted from the daily average temperature (computed by adding the daily maximum and minimum temperatures and dividing by two). If the difference is positive, the day has cooling-degree days. If the difference is negative, the day has heating-degree days.

Example Calculations

Daily high temperature	90	42
Daily low temperature	60	20
Daily average temperature	75 (150÷2)	31 (62÷2)
Threshold temperature	-65	-65
Difference	10 (10 CDDs)	-34 (34 HDDs)

Tables 3.14 and 3.15 provide monthly HDD and CDD data, respectively, for the period 1945 through 1998. The HDDs are traditionally totaled for the 12-month period July through June of the following year.

4.0 Precipitation Climatology

4.1 Monthly and Annual Totals

Table 4.1 shows monthly and annual precipitation totals for the period of record, 1946 through 1998. Normal monthly precipitation amounts for the period 1961 through 1990 and averages for the entire period of record are noted on the table, as are monthly and annual extremes. Normal annual precipitation at the HMS is 6.26 in. The wettest year on record was 1995, with 12.31 in.; the driest was 1976, with 2.99 in.

The months of November through February provide 3.35 in. (54%) of the normal annual precipitation. December is the wettest month, receiving 1.03 in.; July is the driest, receiving only 0.18 in. The wettest month on record was December 1996, with 3.69 in. September 1991, August 1988, and August 1955 received no precipitation.

4.2 Seasonal Precipitation

Table 4.2 provides seasonal precipitation information, with normal and average seasonal data noted. The extremes for each season are also noted. The wettest season was the winter of 1996-1997, with 5.45 in.; the driest received only 0.03 in. (summer 1973).

4.3 Average Number of Days with Specified Amounts of Precipitation

Table 4.3 presents information on the average number of days per year with precipitation events in six categories. A trace is <0.005 in. of precipitation. An average of 124 days per year have a trace or more of precipitation; however, only 23 days receive totals of 0.10 in. or more. During the 53-year period of record, only 4 days had an inch or more of precipitation.

4.4 Total Time with Precipitation Observed

The total time during which precipitation was observed at the HMS includes all types of precipitation. Observations of precipitation are recorded in hours and minutes, with the weather observer recording the starting and ending time of each precipitation event. These data are presented in Table 4.4. No record was kept for the hours 1600 through 2400 from July 1971 through June 1974; therefore, a 3-year gap exists in the record for those hours. Also, beginning in late April 1995, operations at the HMS were decreased to 8 h (0600 to 1400) on weekends and holidays. However, a combination of precipitation

(a) Most recent of several occurrences.

sensors and computer programs was initiated to help ascertain the beginning and ending times of precipitation events during periods when the HMS is not staffed. Table 4.5 lists total hours of precipitation by month for the period 1946 through 1998. As previously noted, complete precipitation duration data for the period July 1971 through June 1974 are not available, and incomplete data are not included.

The months of November through February, which contribute more than half of the annual precipitation, received precipitation 10.3% of the time, >3 times the other 8 months of the year (3.4%).

4.5 Notable Wet Periods

Nine periods are listed when precipitation was abnormally high:

Period	Number of Days with Trace or More			Total Amount, in.	
	Altogether	Greatest Consecutive	Measurable Precipitation	Water Equivalent	Snow-fall
Oct 7 - Nov 4, 1947	23 out of 29	10	17	2.21	0.00
Jan 3 - 28, 1950	21 out of 26	10	15	1.80	23.4
Nov 11 - Dec 19, 1950	33 out of 39	12	20	1.37	3.7
Nov 16 - Dec 22, 1955	31 out of 37	15	24	3.19	22.7
Oct 31 - Dec 7, 1973	32 out of 38	14	20	3.45	8.1
Nov 15 - Dec 7, 1985	17 out of 23	8	14	1.96	25.2
Dec 27, 1992 - Jan 23, 1993	26 out of 29	12	19	2.02	26.8
Nov 13 - 27, 1996	12 out of 15	7	10	2.66	11.9
Dec 20 - 31, 1996	11 out of 12	9	9	3.00	20.1

From a precipitation standpoint, 1973 was an unusual year. Total precipitation for 1973 was 8.27 in., 132% of normal (6.26 in.). The period March 30 through September 18, 1973 was extremely dry, receiving only 0.29 in. of precipitation during that 173-day period; however, the period October 31 through December 7, 1973 was a notable wet period. During the months of October, November, and December 1973, 6.38 in. of precipitation were recorded, 289% of normal (2.21 in.) for those months. November and December 1996 received 6.36 in. of precipitation, 328% of normal (1.94 in.) for those months, which is greater than the normal precipitation amount for an entire year (6.26 in.).

4.6 Notable Dry Periods

The HMS is in a semiarid region, thus it experiences many dry periods. January, March, and December are the only months that have always received measurable precipitation (1946 through 1998).

Table 4.5. Total Duration (h) of Precipitation by Month and Year

Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual

(a) Greatest and least values.

(b) Incomplete data not included. See Section 4.4.

(c) Most recent of numerous occurrences.

A total of 37 months during the period of record have been without measurable precipitation, with the months of July and August accounting for 20 of those months. The record number of consecutive days with no precipitation (not even a trace) occurred in 1988, when the period July 14 through September 17 (66 days) was totally dry. The following list indicates some long periods with small amounts of precipitation.

Notable Dry Periods				
Year	From	To	Number of Days	Total Precipitation, in.
1952	Jun 30	Nov 10	134	0.20
1967	Jun 22	Nov 7	139	0.18
1968	Feb 24	Aug 13	172	0.32
1973	Mar 30	Sep 18	173	0.29
1976	Aug 26	Dec 31	128	0.15
1985	Mar 31	Sep 7	161	0.43
1986	May 6	Sep 12	129	0.30
1987	Jul 19	Oct 31	105	0.08
1988	Jun 6	Sep 17	105	0.13

The driest year on record was 1976, which had 2.99 in. recorded (<50% of normal). During the period September through December 1976, total precipitation was 0.15 in., which was 6% of normal (2.52 in.) for those months.

4.7 Snowfall

Snowfall, which includes all frozen precipitation, varied from a seasonal total of 0.3 to 56.1 in. in 1957-1958 and 1992-1993, respectively. Table 4.6 provides information on monthly and seasonal snowfall amounts, as well as the dates and amounts of earliest and latest snowfall each season. The earliest measurable snowfall (0.3 in.) was recorded on October 26, 1957; the latest measurable snowfall (1.0 in.) was recorded on April 6, 1982. The average date of the first measurable snow is November 30; the last measurable snow date is February 11. Normal snowfall for the period 1961 through 1990 and averages for the entire period of record are noted on the table, as are monthly and seasonal extremes.

Table 4.7 lists the greatest single storm snowfall amounts by month for the period 1946 through 1998. The greatest single snowstorm, on February 18-20, 1993, produced 12.4 in. of snow. During the winter of 1957-58 (actually the only snowfall was recorded in October – not yet winter), the greatest single snowstorm produced only 0.3 in.

Table 4.8 lists some miscellaneous snowfall statistics for the HMS for the period 1946 through 1998. Included in this table are average number of days per month with snow depth above certain threshold values, greatest number of days per month with snow depth above certain threshold values, record number of consecutive days with snow depth above certain threshold values, record monthly snow depth, and 24-h snowfall amounts. The record snow depth at the HMS is 15.6 in., recorded in December 1985. The record number of days with snow depth ≥ 6 in. was 43 days in the winter of 1992-1993.

Table 4.6. Monthly and Seasonal Snowfall (in.), Including First and Last Dates of Both Trace and Measurable Snowfalls

≥12 in.	6	January 15, 1993		January 20, 1993			

(a) Denotes < ½ day.

(b) Year of occurrence in parentheses.

PST = Pacific Standard Time.

4.8 Normal and Maximum Daily Precipitation

Table 4.9 contains annual maximum precipitation statistics for the time periods 1, 2, 3, 6, 12, and 24 h, including the dates of occurrence for each time period, for 1947 through 1998. Table 4.10 contains normal and maximum values of precipitation (minimum values are not needed because every day of the year has a minimum value of 0). The normal precipitation values are based on the period 1961 through 1990; the daily maximum values are for the entire period of record (1945 through 1998). The maximum daily value for each month is noted on the table.

Climatologically speaking, the wettest period of the year is from December 14 through 24, with each day having a normal precipitation value of 0.04 in.; the driest period is from July 23 through August 11, with each day having a normal value of only a trace. October 1, 1957, recorded the greatest 1-day precipitation, 1.60 in. There have been only 5 days during the period of record that have never received measurable precipitation (all have received a trace however).

Table 4.9. Maximum Precipitation (in.)

(a) Latest of several occurrences.

(b) Greatest and year of occurrence.

T = Trace.

5.0 Wind Climatology

5.1 Monthly and Annual Prevailing Wind Directions, Average Speeds, and Peak Gusts

At the HMS, the prevailing wind direction for every month of the year is either WNW or NW (Table 5.1), and the peak gusts for every month are from the SSW, SW, or WSW. The highest monthly average wind speeds occur in June, the lowest in December. The variability in monthly average wind speeds is much greater in the winter months than during the remainder of the year. The highest January average (10.3 mph) is <3.5 times greater than the lowest (2.9 mph); however, in June, the highest average (10.7 mph) is only 1.4 times greater than the lowest (7.7 mph).

Table 5.1. Monthly and Annual Prevailing Wind Directions, Average Speeds, and Peak Gusts at 50-Foot Level, 1945 Through 1998

Month	Prevailing Direction	Average Speed, mph	Highest Average, mph	Year	Lowest Average, mph	Year	Peak Gusts

Annual	NW	7.6	8.4	1983	6.2	1989	80	SW	Jan 1972

(a) Also in earlier years.

5.2 Days with Peak Gusts Above or Below Specific Thresholds

Table 5.2 lists the number of days by month and year with peak wind gusts (at 50 ft) above or below specific threshold wind speeds. June and July have the highest average number of days with gusts ≥ 25 mph (nearly 20 each); however, January, March, and April have the highest average number of days with gusts ≥ 40 mph (nearly 3 days) and January has the highest average number of days with gusts ≥ 50 mph (0.8 day). January also has the record highest number of gusts ≥ 40 and ≥ 50 mph at 11 and 7 days, respectively, in 1990. Calendar year 1990 recorded the most days with gusts ≥ 40 and ≥ 50 mph

Table 5.2. Number of Days with Peak Gusts Above or Below Specific Thresholds at 50-Foot Level, 1945 Through 1998

Month	Days with Peak Gusts ≤12 mph					Days with Peak Gusts ≥25 mph					Days with Peak Gusts ≥40 mph					Days with Peak Gusts ≥50 mph

(a) Most recent of multiple occurrences.

at 57 and 18 days, respectively. Of particular interest is that previous records for these categories were 41 days ≥ 40 mph in 1961 and 10 days ≥ 50 mph in 1972.

5.3 Frequency of Monthly and Annual Wind Direction and Speed at 50-Foot Level

Table 5.3 presents HMS data on the percent frequency of monthly and annual wind direction and wind speed at 50 ft. This table shows that for every month of the year the prevailing wind direction is either from the WNW or NW. Winds are relatively evenly distributed from the NNE through the SSW at between 2% and 4% on an annual average for each direction.

Table 5.3. Frequency (%) of Monthly and Annual Wind Direction and Speed at 50-Foot Level, 1955 Through 1998

The wind speed class with the highest frequency of occurrence is 4 to 7 mph, with winds in that category 37% of the time. The speed class with the second highest frequency is 8 to 12 mph, at 25%. Winds averaging >25 mph occur only 1% of the time on an annual basis, with the highest frequency occurring in March and April (1.5%).

5.4 Composite Wind Roses and Joint Frequency Distributions for the Hanford Meteorological Monitoring Network

Figure 5.1 and Table 5.4 contain composite wind roses and joint frequency distributions at the 10-m level for the entire HMMN (see Table 1.1 and Figure 1.1) for the period 1982 through 1998.

Figure 5.2 and Table 5.5 contain composite wind roses and joint frequency distributions at the 60-m level for stations 9, 11, 13, and 21 for the period 1986 through 1998.

6.0 Miscellaneous Climatological Statistics

6.1 Sky Cover

The term sky cover is used to express the portion of the celestial dome that is 1) covered, but not necessarily hidden, by clouds or obscuring phenomena aloft; 2) hidden by an obscuring phenomenon on the ground (such as fog or smoke); or 3) a combination of both 1 and 2. The sky cover is determined hourly by scanning the sky and estimating the number of tenths that are covered (0 denotes clear and 10 denotes overcast). Average monthly sunrise-to-sunset sky covers for the period 1946 through 1998 are shown in Table 6.1. Also shown in Table 6.1 are the number of clear, partly cloudy, and cloudy days for the period 1954 through 1998. The number of clear, partly cloudy, and cloudy days is the result of assigning each day to one of the following categories based on its average sky cover for that day:

<u>Category</u>	<u>Average Sky Cover</u>
Clear	0 - 3 tenths
Partly cloudy	4 - 7 tenths
Cloudy	8 - 10 tenths

During the period of record (1954 through 1998), an average of 200 sunny days (the sum of the clear and partly cloudy days) was recorded per year at the HMS.

6.2 Fog and Dense Fog

Table 6.2 shows the average monthly and annual number of days with fog and dense fog. Fog is reported any time horizontal visibility is reduced to 6 mi or less because of the suspension of water droplets in the surface layer of the atmosphere. Dense fog is reported when horizontal visibility is reduced to 0.25 mi or less. Most fog at the HMS is radiation fog, a common type of fog that forms on nights characterized by light wind, clear sky, and moist air in the lower levels of the atmosphere. Nearly 90% of both fog and dense fog at the HMS occurs during the late autumn and winter months, though fog is observed every month of the year.

6.3 Psychrometric Data

Psychrometric data include observations of dry bulb, wet bulb, dew point temperatures, and relative humidity. The dry bulb temperature is the temperature of the ambient air; the wet bulb temperature is the lowest temperature to which a parcel of air, under constant pressure, can be cooled by evaporating water into it. The dew point temperature is the temperature to which a given parcel of air, under constant

Longest duration of fog: 113.7 h, December 16-20, 1985.

Longest duration of dense fog: 47.0 h, December 1957.

pressure and water-vapor content, must be cooled to attain saturation. Relative humidity is the ratio of the actual water-vapor content of the air to the one where saturation would occur if the pressure and temperature remained unchanged.

Table 6.3 presents monthly averages and extremes of dry bulb, wet bulb, dew point temperatures, and relative humidity from the HMS for the period 1950 through 1998. These parameters are collected hourly and are averaged on a monthly (as opposed to a daily) basis. Prior to 1975, wet bulb temperatures $\geq 75^{\circ}\text{F}$ had never been observed at the HMS. On July 8, 9, and 10, 1975, 7 hourly observations were made of wet bulb temperatures $\geq 75^{\circ}\text{F}$.

6.4 Solar Radiation

Table 6.4 presents average and extreme daily solar radiation values by month for the period 1953 through 1998. These data are reported in langley (a langley is a unit defined as 1 gram calorie per square centimeter.)

The highest daily values occur with a clear sky and clean air; the lowest commonly occur on days overcast with low stratus clouds. The lowest midday values of hourly solar radiation occurred on May 18, 1980, as the dense ash cloud from the morning eruption of Mount St. Helens passed over eastern Washington. Hourly solar radiation values dropped to 0 at 1100 h and remained at 0 for the rest of that day.

6.5 Thunderstorms

A thunderstorm day is one in which thunder is heard at the observing station one or more times during a calendar day. If a thunderstorm were to begin before midnight and continue until after midnight, it is possible to have two thunderstorm days from a single storm.

Table 6.5 shows that thunderstorms occurred in every month of the year, except January and November. The thunderstorm season is essentially from April through September. The average number of thunderstorm days per year is 10; however, the total varies from a low of 3 in 1949 to a high of 23 in 1948. The largest number of thunderstorms in any single month was 8 in June 1972, July 1983, and August 1953.

Table 6.5. Average Number of Days of Various Meteorological Phenomena, 1945 Through 1998

Phenomenon	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
Thunderstorm	0	≤0.1	0.1	0.8	1.6	2.3	2.2	1.9	0.8	0.2	0	≤0.1	10.0
Dust or blowing dust	0.4	0.4	0.5	0.6	0.7	0.4	0.4	0.3	0.5	0.3	0.2	0.2	4.7
Glaze	2.2	0.7	0.1	0	0	0	0	0	0	0	0.8	2.4	6.2

6.6 Dust and Blowing Dust

The criterion for both dust and blowing dust is that horizontal visibility be reduced to 6 mi or less. Dust is carried into the area from a distant source and may occur without strong winds. Blowing dust occurs when dust is being picked up locally and occurs with stronger winds. Both dust and blowing dust occurred at the HMS; however, in most cases, it is blowing dust. Table 6.5 presents the average number of days per month and year of dust and blowing dust during the period 1945 through 1998. The average number of days per year with dust or blowing dust is 5. The greatest number of such days in any year was 20 in 1980; the fewest was 0 in 1987 and earlier years. The greatest number of days with dust or blowing dust in any month was 9 in May 1980. This peak in the number of days with dust or blowing dust resulted from the eruption of Mount St. Helens on May 18, 1980 and subsequent dates.

6.7 Glaze

Glaze is a coating of ice formed when rain or drizzle freezes on contact with any surface having a temperature that is below freezing. Table 6.5 provides data on the number of days per month and year with glaze for the period 1945 through 1998. The average number of days with freezing rain or freezing drizzle is 6. The highest number of days with glaze in any winter season was 18 during the winter of 1969-1970; the least, 1 day during the winter of 1987-1988 and earlier winters. The greatest number of such days in any single month was 9 in January 1970.

6.8 Atmospheric Pressure

Table 6.6 contains atmospheric pressure data for the period 1955 through 1998. This table lists both station and sea-level pressure, including extremes and years of occurrence. Atmospheric pressure may be indicated in several different units, including inches of mercury, millimeters of mercury, millibars, or Pascals; however, in this table, pressure is stated in inches of mercury. Station pressure is the barometric pressure measured at the HMS (at an elevation of 733 ft); sea-level pressure is the station pressure adjusted to sea level. Most are familiar with barometric pressure adjusted to sea level, which allows atmospheric pressures for all locations to be compared, regardless of the elevation of the station where the data are measured.

The highest sea-level pressure ever recorded at the HMS was 31.12 in. in January 1979; the lowest was 28.94 in. in December 1995 and on previous occasions.

Some rapid pressure changes occurred on November 3, 1958, falling 0.492 in. over a 6-h period (0.082 in./h), including a 1-h fall of 0.160 in. On the same day, the pressure rose 0.554 in. during a 6-h period (0.090 in./h), including a 1-h rise of 0.145 in. The greatest sea-level pressure change during a 1-day period was 1.02 in. (December 8, 1971).

(a) Most recent of several occurrences.

7.0 Extreme Values

Extreme values are generally described in terms of probability of occurrence or in terms of return period. For low probability events, the return period is simply the reciprocal of the probability when the probability is expressed as the likelihood of the event occurring in a given year. As with all estimate extreme values, the uncertainty in the estimates increases as the return period increases.

7.1 Annual Temperature Extremes

Annual maximum and minimum temperatures with return periods from 2 to 1000 years are listed in Table 7.1. The probabilities of exceeding various maximum and minimum temperatures are shown in Figures 7.1 and 7.2 along with the maximum and minimum temperatures observed at the HMS from 1945 through 1998. The curves were estimated by assuming that the annual extreme temperatures may be fit using a normal distribution and calculating distribution parameters from the observed data.

7.2 Precipitation Rates

Maximum precipitation rates for return periods of 2 to 1000 years are listed in Table 7.2. The corresponding precipitation amounts are listed in Table 7.3. The precipitation rate estimates are based on precipitation measurements made at the HMS from 1947 through 1998. The precipitation rates were estimated for each return period assuming a lognormal distribution and distribution parameters calculated from the data. Figure 7.3 shows the predicted rates for 1, 3, 6, and 12 hours duration along with the observed data.

Table 7.1. Return Periods for Annual Maximum and Minimum Temperatures

7.3 Snow

Snow extremes for return periods from 2 to 1000 years are listed in Table 7.4. The estimates are based on data from the HMS for the 1946-1947 through 1997-1998 snow seasons. The values in the tables were estimated assuming a Type 1 (Gumbel) extreme value distribution (Johnson et al. 1995) using maximum-likelihood estimates (Kinnison 1985) of the distribution parameter values calculated from the HMS data. Figures 7.4, 7.5, and 7.6 show the probabilities of seasonal maximum snowfall, maximum single storm snowfall, and maximum snow depth, respectively with the corresponding HMS data.

Figure 7.3. Probability of Precipitation Rate Exceeding Given Values by Duration

Table 7.4. Snowfall Extremes for Return Periods from 2 to 1000 Years

Return Period (yr)	Seasonal Total (in.)	Single Storm (in.)	Maximum on Ground (in.)
2	13.6	3.8	5.1
5	23.3	6.0	8.2
10	29.6	7.5	10.3
20	35.7	8.9	12.3
50	43.7	10.7	14.9
100	49.6	12.1	16.9
200	55.5	13.4	18.8
500	63.3	15.2	21.4
1000	69.2	16.5	23.3

Figure 7.4. Probability of Exceeding a Given Seasonal Snowfall

Figure 7.5. Probability of Exceeding a Given Snowfall in a Single Storm

7.4 Peak Wind Gusts

Peak wind gusts for return periods of 2 to 10,000 years are listed in Table 7.5 for heights of 30.5, 50, 200, and 400 ft above ground. The peak wind gust estimates are based on wind measurements made at the 50, 200, 400-ft levels of the tower at the HMS. The peak wind gusts for each return period for these

Figure 7.6. Probability of Exceeding a Given Snow Depth

Table 7.5. Peak Wind Gusts (mph) for Return Periods from 2 to 10,000 Years

Return Period (yr)	Height Above Ground			
	10 m	50 ft	200 ft	400 ft
2	57.4	60.2	67.5	71.6
5	63.6	66.7	75.3	80.5
10	67.8	71.0	80.5	86.4
20	71.7	75.2	85.4	92.1
50	76.9	80.5	91.8	99.4
100	80.7	84.6	96.6	104.8
200	84.5	88.6	101.4	110.3
500	89.6	93.9	107.7	117.5
1,000	93.4	97.9	112.4	122.9
2,000	97.2	101.9	117.2	128.4
5,000	102.2	107.1	123.5	135.6
10,000	106.1	111.1	128.2	141.0

levels were estimated assuming a Type 1 extreme value distribution and maximum likelihood distribution parameters calculated from the HMS data. The peak wind gusts for the 30.5-ft (10-m) level were made by first adjusting the peak gusts observed at 50 ft to 30.5 ft using the technique described by Peterka and

Shahid (1998) and then calculating the distribution parameters using maximum likelihood techniques. Figure 7.7 shows the probabilities of peak wind gusts at all four levels along with the HMS peak wind gust data for 50, 200, and 400 ft.

Figure 7.7. Probabilities of Peak Wind Gusts Exceeding Given Values

Appendix

1998 Wind Climatology

Appendix

1998 Wind Climatology

This appendix provides the 1998 station-specific wind roses (Figures A.1[a] and A.2[a]) from the Hanford Meteorological Monitoring Network. Each petal of the wind rose represents the proportional amount of time that the wind blew from that direction. The width of the petal corresponds to each wind speed category. Starting from the center of the rose, the narrowest petal represents winds in the 1- to 3-mph class, the next widest represents the 4- to 7-mph class, and so forth. The length of each of these petals is proportional to the frequency of occurrence for each speed class.

The wind speed histograms (Figures A.1[b] and A.2[b]) represent the proportional amount of time in each speed class.

Table A.1 lists joint frequency distributions (at 10 m) of wind direction versus wind speed class for the individual stations (see Figure 2.1 in text for locations). Table A.2 lists joint frequency distributions (at 60 m) for stations 9, 11, 13, and 21 (see Figure 2.2 in text for locations).
