Key Words: Portable Exhauster, GEMS, Skid, Saltwells, POR04, POR05, POR06

Abstract: Condensation must be prevented from collecting on the 500 CFM portable exhauster filters. To ensure the air stream is above the dew point, it will be heated. The purpose of this document is to determine the maximum temperature and water content of the air stream and how much it should be heated to prevent condensation formation problems. Additionally, the maximum possible temperature the continuous air monitor (CAM) head will be exposed to will be compared to the allowable.

TRADEMARK DISCLAIMER. Approved for Public Release

BACKGROUND

500 cfm portable exhausters will be utilized on single shell tanks involved in saltwell pumping. This will be done, in part, to remove flammable gases from the tank vapor space. The exhaust filter train, fan, stack, and associated instrumentation and equipment are mounted on a portable skid. The design analysis and basis for the skid system design are documented in reference 1.

A pumped drainage collection system is being added to the existing portable exhausters. Additional equipment and instrumentation are also being added to the exhausters, including a vacuum pump cabinet and a generic effluent monitoring system (GEMS). The GEMS will provide sampling and monitoring capabilities.

PURPOSE

The purpose of this analysis is three fold. First, to determine the maximum saltwell tank vapor space temperature. Second, to determine an allowable exhauster inlet air temperature increase to ensure the humidity is less than 70%. Third, to assess potential adverse temperature effects to the continuous air monitor (CAM) sample head.

The results of this analysis will be used to ensure that air stream temperatures in the portable exhausters are increased sufficiently to prevent condensation from forming on either the pre or HEPA filters without adversely affecting the CAM.

ANALYSIS APPROACH

The following will be determined in this analysis:

- I. Determine the Maximum Saltwell Tank Vapor Space Temperature**
- II. Determine a Reasonable Exhauster Inlet Air Temperature Increase**
- III. Evaluate Air Temperature Relative to CAM Sample Head Operation**

ASSUMPTIONS AND BASIS

1. The tank vapor space evaluation covers October 1995 thru October 1998.
2. The humidity of the air stream must be equal to or less than 70% relative humidity after being heated.
3. The maximum exhauster inlet temperature from any saltwell tank, prior to heating, is 120 degrees Fahrenheit at 100% relative humidity (see ref. 4).
4. None of the saltwell tanks will receive higher activity (thermally hotter) waste.
5. The data used as a basis for this report originates from the Surveillance Analysis Computer System (SACS). This data is the most defensible and up-to-date information available.

SUMMARY OF KEY FINDINGS

1. The maximum inlet exhauster temperature is conservatively 120 degrees Fahrenheit.
2. Increasing the air stream temperature a maximum of 20 degrees Fahrenheit will prevent condensation.
3. The CAM will not be adversely effected by sample stream temperatures.

ANALYSIS

I. Determine the Maximum Saltwell Tank Vapor Space Temperature

To determine the vapor space temperatures, a list of the saltwell tanks was first developed. The portable exhauster has the potential of being utilized on any of the saltwell tanks. Then tank liquid levels were determined and compared with thermocouple locations. With this information, vapor space temperatures were then determined and plotted. The summary of the temperature results for each of the saltwell tanks and the SACS data from which these temperatures were determined are attached.

With the exception of two temperature spikes, which appear to be anomalies, the minimum and maximum temperature range which bounds all the tanks is 71 to 107 degrees Fahrenheit. The maximum temperature spike was 115 in tank A-101. For conservatism, the value of 120 degrees Fahrenheit will be used as the maximum exhauster inlet temperature at 100% relative humidity. This is also the maximum temperature given in reference 4. Using the maximum temperature as the basis for the analysis will ensure that the highest amount of moisture in the air stream is accounted for.

II. Determine a Reasonable Exhauster Inlet Air Temperature Increase

The approach will be to assess a 20 degree inlet air temperature increase and evaluate it's reasonableness.

$$\phi = P_v / P_s \text{ (Ref. 3)}$$

Where

ϕ = RH = relative humidity

P_v = partial pressure of the vapor in the actual gas mixture, inches Hg, absolute

P_s = partial pressure of the vapor in a saturated gas mixture, inches Hg, absolute

At 120 degrees F and 100 % RH, $P_s = P_v = 3.45052$ in. Hg (Ref. 3)

At 140 degrees F and 100% RH, the partial pressure of water is $P_s = 5.88939$ in. Hg (Ref. 3)

The inlet and outlet mass is the same. Therefore:

$$\phi = 3.45052 \text{ in. Hg} / 5.88939 \text{ in. Hg} \approx .586$$

In percent, $\phi = 58.6\% < 70\%$

As a check, the alternative approach below will be used.

$$\phi = n_v / n_s \text{ (Ref. 3)}$$

Where

ϕ = RH = relative humidity

n_v = mole fraction of the vapor in the mixture, constant at 120 F and 140 F

n_s = mole fraction of the vapor in a saturated mixture

$$1 \text{ lb dry air (da)} \times 1 \text{ lbmole} / 28.96 \text{ lb da} = .034530 \text{ lbmole da}$$

$$\text{At 120 F, } W = \text{humidity ratio} = .081560 \text{ lb water/lb da}$$

$$.081560 \text{ lb water} \times 1 \text{ lbmole} / 18 \text{ lb water} = .004531 \text{ lbmole water}$$

$$n_v = .004531 \text{ lbmole water} / (.004531 \text{ lbmole water} + .034530 \text{ lbmole da}) = .115998$$

At 140 F, W = humidity ratio = .153538 lb water/lb da

.153538 lb water x 1 lbmole/18 lb water = .008530 lbmole water

$n_a = .008530 \text{ lbmole water} / (.008530 \text{ lbmole water} + .03453 \text{ lbmole da}) = .198094$

$\phi = 100(n_v / n_a) = 100(.115998 / .198094) = 58.6\% < 70\%$

Heating the exhauster inlet air 20 degrees F exceeds the design requirements.

III. Evaluate Air Temperature Relative to (CAM) Sample Head Operation

Eberline vendor information states that the CAM sample head can operate at a temperature up to 140 Fahrenheit without degradation or adversely effecting monitoring readings. Because the maximum exhauster inlet temperature has been conservatively taken as 120 degrees Fahrenheit, the maximum it can be internally heated to is 140 degrees Fahrenheit. Additionally, the air stream can also experience heat loss or heat gain as it is routed from the inlet, through the filtration bank, fan, stack (to the point where the sample is taken), and thru the sample lines, depending on the ambient conditions. However, the residence time of the air stream in the exhaust system is very short, making temperature changes due to external influences insignificant. Therefore the temperature is not expected to exceed the 140 degree maximum, protecting the sample head CAM from adverse effects.
