1.0 INTRODUCTION

This test report provides the results from the performance of Acceptance Test Procedure (ATP) RPP-5772, revision 1, for Pumping Instrumentation and Control (PIC) skid “P”. The ATP verifies the proper construction of the PIC skid “P” by Site Fabrication Services along with proper programming of the Programmable Logic Controller (PLC) by engineering. New PIC skid “P” will be used for the pumping tank A-101. A copy of the actual test results is in the Appendix of this document.

2.0 DESCRIPTION OF TEST

The test was performed at the Site Fabrication Services location. The ATP ensured the PIC skid was assembled and functioned as per the design drawings. Inputs to the skid were simulated to ensure proper equipment connections and wiring.

The ATP document provided detailed instructions for each test step and spaces for recording the data and signoffs. A copy of the test results including exceptions is in the Appendix.

3.0 TEST METHOD AND TEST EQUIPMENT

The ATP detailed the test methods and the test equipment to be used for testing. Test equipment identification and calibration dates are recorded on the ATP data sheets. Quality Assurance Inspectors and Engineering witnessed the performance of the ATP.
4.0 TEST RESULTS

The ATP was successfully completed. Discrepancies in the test procedure were listed as exceptions. All the exceptions identified became part of the ATP and are in the Appendix along with the ATP results. Exception 1 is corrected the percentage values for the CGM and FGM readouts at 10mA and 20mA inputs. Exception 2 is an editorial correction for the wording on the CGM failure alarm window. Both exceptions were recorded on exception records and were reviewed, resolved and signed off as closed for this ATP.

A National Electrical Code (NEC) inspection was performed as part of the ATP. The NEC inspector accepted the electrical power portion of the skid and placed a blue acceptance sticker on the distribution panel. A Pressure Vessel inspector checked the water and air compressor tanks along with the associated relief valves. The installation of these tanks was acceptable. The safety relief-valves on the air and water tanks were functional checked as part of the ATP. Copies of the NEC and Pressure Vessel inspection reports are in the Appendix of this document.

5.0 CONCLUSIONS AND RECOMMENDATIONS

The PIC skid is found to be ready for field operation. All exceptions were resolved. An Operational Test Procedure (OTP) will be performed after the skid is set up for field configuration.

4.1 DRAWING VERIFICATION

A check of the constructed skid is to be compared to either the redlined drawings or the final unreleased skid drawings. Engineering and Quality Assurance shall verify the accuracy of the essential and support drawings. Engineering shall determine a resolution for all discrepancies by either correcting the drawings or changing the equipment.

The following drawings shall be walked down for verification of proper construction of the skid:

4.1.1 Wire terminations and wiring labels on drawings H-14-103791, sheets 7 through 12 and H-14-103794, sheet 5.
4.1.2 Panel board arrangement on drawing H-14-103797.
4.1.3 Flow diagram on drawing H-14-103796.

Drawing verification completed. (Final drawing release is not required to continue with this ATP.)

4.2 REDLINE INCORPORATION

4.2.1 Ensure the relines identified on the construction drawings in the fabrication work package are incorporated on the final drawings for skid “P” prior to the drawings being released. NOTE: Redlines must meet the intent of the markups and may not be exactly the same in order to meet drafting standards or for clarity.

4.2.2 Engineer to verify the redline incorporation is completed by signing below.

4.3 PRESSURE VESSEL INSPECTION

A pressure vessel inspection by a third party inspector is required for the air compressor receiver tank and relief valves located in the air compressor cabinet and the water tank and relief valves located in the water cabinet. The inspection is to verify that the equipment meets National Codes for pressure vessels. An outside-certified inspector shall perform this inspection. (This inspection shall be completed prior to testing the air compressor and water systems.)

Pressure vessel inspection report received. (The ATP can continue before the report is received, but must be received prior to final sign-off.) QA shall verify receipt of completed Pressure Vessel report.
