4. REMARKS

This is an approved SCOPING Design Analysis. The QAP 2-0 Activity Evaluation, "Perform Criticality, Thermal, Structural, and Shielding Scoping Analysis", DI#: BB0000000-01717-2200-00026 REV 01, lists the procedural controls which are required. Therefore, this design analysis is NOT subject to the QAP 3-series procedures and does not require QAP 3-9 signatures. All information contained in this analysis is TBV and has received a technical review only.

1. Purpose

This analysis is prepared by the Mined Geologic Disposal System (MGDS) Waste Package Development Department (WPDD) as specified in the Waste Package Implementation Plan (pp. 4-8, 4-11, 4-24, 5-1, and 5-13; Ref. 5.10) and Waste Package Plan (pp. 3-15, 3-17, and 3-24; Ref. 5.9). The design data request addressed herein is:

- 1) Characterize the conceptual 40 BWR Multi-Purpose Canister (MPC) Waste Package (WP) design to show that the design is feasible for use in the MGDS environment.

The purpose of this analysis is to respond to a concern that the long-term disposal thermal issues for the Multi-Purpose Canister (MPC) Subsystem Design do not preclude MPC compatibility with the MGDS. The objective of this analysis is to provide thermal parameter information for the conceptual MPC design with disposal container under nominal MGDS repository conditions. The results are intended to show that the design has a reasonable chance to meet the MGDS design requirements for normal MGDS operation and to provide the required guidance to determining the major design issues for future design efforts. Future design efforts will focus on specific MPC vendor designs when they become available.

2. Quality Assurance

The QA program applies to this analysis. The information in this analysis concerning disposal long-term thermal parameters for the conceptual MPC WP will be used as a guide as to the possible requirements which might be used in the MPC WP design. The performance of the MPC internals will affect the proper function of the waste package and the waste package has been identified as an MGDS Q-List item important to safety (Ref. 5.4, p. 5). The work performed for this analysis is covered by reference 5.2, Perform Criticality, Thermal, Structural, and Shielding Scoping Analysis, which is part the WPDD QAP-2-0 Work Control evaluation documents. This QAP-2-0 evaluation determined such activities are subject to Quality Assurance Requirements and Description (QARD) (Ref. 5.3) requirements. Applicable procedural controls are listed in the evaluation.

3. Method

The analytical method to be employed is Finite Element Analysis (FEA). The analysis will build upon the Emplacement Scale Thermal Evaluations (Ref. 5.13) and the PWR Effective Thermal Conductivity Analysis (Ref. 5.11) by using the same method for SNF thermal modeling and the results for the WP surface temperatures from the three-dimensional emplacement scale model. Thus, the BWR MPC internals will be modeled with the Spent Nuclear Fuel (SNF) approximated

Originator: Thomas L. Lotz	Checker: Robert H. Bahney III
-----------------------------------	--------------------------------------

by a homogeneous material property region based upon the GE-7 BWR-5 fuel assembly data (pp. 2A-21, 2A-22, Ref. 5.12 and p. 26, Ref. 5.39) and the SNF effective thermal conductivity calculations (Ref. 5.11). Peak SNF cladding temperatures will also be determined using the Wootton-Epstein Correlation (Ref. 5.14) for comparison purposes. The calculation shall be performed as a transient analysis to evaluate the first 1000 years of proposed repository operation.

4. Design Inputs

4.1 Design Parameters

Tables 4.1-1 and 4.1-2 lists the material and thermal properties of density, emissivity, thermal conductivity, and specific heat of stainless steel 316 (see Assumption 4.3.23). The density of 316 stainless steel provided in Table 4.1-1 was taken from Table 17 of the Metals Handbook (p. 423, Ref. 5.18). The emissivity provided in Table 4.1-1 was taken from Table 4.3.2 of Marks' Handbook (p. 4-68, Ref. 5.17) and is about average for heated stainless steel 316.

Table 4.1-1. Material Properties of Stainless Steel 316 (Refs. 5.17 and 5.18)

	Density	Emissivity
Stainless Steel 316	8000.0 kg/m ³	0.60

Table 4.1-2 lists the thermal properties of stainless steel 316. Values for thermal conductivity and thermal diffusivity of stainless steel 316 (Cr-Ni-Mo) were taken from Table I-4.0, Appendix I of the 1986 ASME Boiler and Pressure Vessel Code (p. 97, Ref. 5.15) and are converted here to conductivity and specific heat in SI units. The conversion of thermal diffusivity (defined in equation 4.1-1 below) to specific heat requires the density listed in Table 4.1-1.

$$\text{Thermal Diffusivity}(\text{ft}^2/\text{hr}) = \frac{\text{Thermal Conductivity}(\text{Btu}/\text{hr}\cdot\text{ft}\cdot^\circ\text{F})}{\text{Density}(\text{lb}/\text{ft}^3) \times \text{Specific Heat}(\text{Btu}/\text{lb}\cdot^\circ\text{F})}$$

(Equation 4.1-1)

Table 4.1-3 lists the thermal properties of A 516 carbon steel (see Assumption 4.3.24). Values for thermal conductivity and thermal diffusivity of A 516 (C-Mn-Si) were taken from Table I-4.0, Appendix I of the 1986 ASME Boiler and Pressure Vessel Code (p. 97, Ref. 5.15) and are converted here to conductivity and specific heat in SI units. The conversion of thermal diffusivity (defined in equation 4.1-1) to specific heat requires the density listed in Table 4.1-4.

Table 4.1-4 lists the density and emissivity of A 516 carbon steel. The density of A 516 (C-Mn-Si) was taken from Table A.1 of a standard heat transfer text (p. 670, Ref. 5.16) and the emissivity (average for smooth oxidized iron) was taken from Table 4.3.2 of Marks' Handbook (p. 4-68, Ref. 5.17).

Table 4.1-4. Material Properties of A 516 Carbon Steel (Refs. 5.16 and 5.17)

	Density	Emissivity
A 516 Carbon Steel	8131.0 kg/m ³	0.80

Tables 4.1-5 and 4.1-6 lists the material and thermal properties of density, emissivity, thermal conductivity, and specific heat of Alloy 825 (see Assumption 4.3.25). The density of Alloy 825 (Ni-Fe-Cr-Mo-Cu) provided in Table 4.1-5 was taken from the product specifications published by the manufacturer; Huntington Alloys (p. 31, Ref. 5.19). The emissivity of Alloy 825 (Ni-Fe-Cr-Mo-Cu) provided in Table 4.1-5 was taken from the LLNL report on the Thermal Performance of a Buried Nuclear Waste Storage Container Storing a Hybrid Mix of PWR and BWR Spent Fuel Rods. (p. 15, Ref. 5.20).

Table 4.1-5. Material Properties of Alloy 825 (Refs. 5.19 and 5.20)

	Density	Emissivity
Alloy 825	8137.9 kg/m ³	0.80

Table 4.1-6 lists the thermal properties of Alloy 825. Values for thermal conductivity and thermal diffusivity of Alloy 825 (Ni-Fe-Cr-Mo-Cu) were taken from Table I-4.0, Appendix I of the 1986 ASME Boiler and Pressure Vessel Code (p. 97, Ref. 5.15) and are converted here to conductivity and specific heat in SI units. The conversion of thermal diffusivity (defined in equation 4.1-1) to specific heat requires the density listed in Table 4.1-5.

Table 4.1-7 lists the thermal properties of helium (see Assumption 4.3.22). Values for thermal conductivity and thermal diffusivity of helium were taken from Table A.4, Appendix A of a standard heat transfer text (p. 683, Ref. 5.16). Indicated values were linearly interpolated from the data supplied in the reference.

Table 4.1-7. Thermal Properties of Helium (Ref. 5.16)

* Values marked with an * were linearly interpolated from the table because values were not given.

Table 4.1-8 lists the thermal properties of aluminum-boron alloy (see Assumption 4.3.26). Values for thermal conductivity and thermal diffusivity for aluminum-boron alloy were taken from Table 3 of a report by Properties Research Laboratory on the thermal conductivity of aluminum-boron alloy (p. 4, Ref. 5.21). The emissivity of aluminum-boron alloy is assumed to be equivalent to that of a rough plate of aluminum (see Assumption 4.3.26). The emissivity of a rough plate of aluminum at 26°C is 0.07 as reported in Table 4.3.2 of Marks' Handbook (p. 4-68, Ref. 5.17).

Table 4.1-8. Thermal Properties of Aluminum-Boron Alloy (Ref. 5.21)

Temperature		Al-B Alloy Density (kg/m ³)	Thermal Conductivity (W/m·K)	Specific Heat (J/kg·K)
K	°C

4.2 Criteria

The design of the engineered barrier segment (EBS) will depend on thermal analyses of the repository host rock and near-field. Criteria that relate to the thermal analysis of the EBS are derived from the applicable requirements and planning documents. Upper-level systems requirements are provided in the Mined Geologic Disposal System Requirements Document (MGDS-RD) (Ref. 5.6). The requirements flow down to the Engineered Barrier Design Requirements Document (EBDRD, Ref. 5.5) as specific requirements for engineered barrier segment design. The Waste Package Implementation Plan (WPIP) (Ref. 5.10) also provides criteria and goals for the thermal design of the EBS. The criteria applicable to thermal analysis of waste package emplacement are equivalent to the applicable requirements, interface requirements, and criteria cited in the MGDS-RD, EBDRD, WPIP and all requirements which apply to thermal analysis are listed in this section for completeness.

4.2.1 MGDS-RD Requirements for Thermal Design

The criteria applicable to thermal analysis of waste package emplacement which appear in the MGDS-RD (pp. 29, 44, 107; Ref. 5.6) but do not appear in the EBDRD are listed here:

"3.1.5 Major Considerations and Assumptions

- M. It is assumed that loaded MPCs emplaced for disposal will have a maximum thermal output of 14.2 kilowatts. Accommodation of this condition will require management of the waste delivery schedule or storage of loaded MPCs with a higher thermal output until the thermal output has decreased to 14.2 kilowatts. This 14.2 kilowatts is equivalent to the thermal output of 21 PWR assemblies with 40 GWd/MTU burnup and 3.75% initial enrichment 10 years after discharge from a reactor. (Twenty-one assemblies represents the capacity of one of several potential MPC configurations.)"

"3.2.3.2.3 MGDS-Transportation Interface Requirements

- J. The MGDS shall provide an emplacement environment (e.g., waste package design, underground facility design, emplacement mode or orientation, spacing between waste packages, etc.) for the MPC with disposal container, such that an emplaced waste package with thermal output of 14.2 kW will not result in an MPC surface temperature higher than 225°C <TBR> [Ref 2.4.2.C][RW-0199][10 CFR 60.135(a)(2)][Derived by 3.2.1.1.H]

Originator: Thomas L. Lotz	Checker: Robert H. Bahney III
-----------------------------------	--------------------------------------

The MPC Design is responsible for maintaining the peak SNF cladding temperature below the maximum temperature designated for disposal. To meet this requirement, the peak cladding temperature in a loaded MPC with a thermal output of 14.2 kW may not exceed 350°C when subjected to an MPC external wall temperature of 225°C."

"3.7.3.3 Waste Package Requirements

- B.2. Waste packages shall be emplaced in an environment (e.g., waste package design, underground facility design, emplacement mode or orientation, spacing between waste packages, etc.), such that SNF cladding temperatures in an emplaced waste package do not exceed 350 °C <TBR>. [10 CFR 60.135(a)(2)][Derived by CRD 3.2.1.1.H]"

4.2.2 EBDRD Requirements for Thermal Design

The criteria applicable to thermal analysis of waste package emplacement are equivalent to the applicable requirements in the EBDRD (pp. 3-10, 3-14, 3-21, 3-23, 3-25, 3-26, 3-47, 3-49, 3-50, 3-53, and 3-54; Ref. 5.5) and are listed here:

"3.1.5 MAJOR CONSIDERATIONS AND ASSUMPTIONS

....

- B. The assumption used in developing this EB-DRD is that the extent of blending (i.e., the mixing in waste packages of SNF and/or HLW of different thermal outputs) required is limited to that which can be accommodated by the WA process.

Thermal loading studies will determine the extent of blending that must occur. Limited blending can be accomplished at the MRS through the WA process. If significant blending is required, this could have a major impact on the MRS and/or MGDS design and operations, and will be the subject of system studies. If these studies show that changes in system design requirements are necessary, the RDs will be revised."

"3.2.2 RADIOLOGICAL PROTECTION

3.2.2.1 GENERAL REQUIREMENTS

....

- C. The Engineered Barrier Segment, together with the Repository Segment, shall provide adequate shielding from radioactive components and high ambient temperatures. [Derived]"

Originator: Thomas L. Lotz

Checker: Robert H. Bahney III

"3.2.3.3 ENGINEERED BARRIER SEGMENT - REPOSITORY SEGMENT
INTERFACE REQUIREMENTS

....
A.8. The Repository Segment will accommodate the emplacement concept (TBD) selected during ACD. [Derived]

....
b. The Repository Segment design will prevent free-liquid-phase water from contacting the waste package during the period from package insertion until repository closure. [Derived]

c. The Repository Segment layout will be designed so that a combination of characteristics will assist in keeping liquid water from contacting the waste packages for the first 300 to 1000 (TBV) years after closure. [Derived]

d. The Repository Segment layout will also ensure that the design limit temperatures (TBD) for waste forms are not exceeded. [Derived]

....
A.10 If the design requires the waste form to be transferred for any purpose (such as from shipping casks to waste packages), the Repository Segment is responsible for the following:

....
b. Repository Segment options at the surface handling facility will be designed so that cladding failure from mechanical abrasion or deformation considering thermally-induced effects will result in less than five percent (TBV) cladding strain. [Derived]

....
A.17 The underground facility will be designed so that the performance objectives will be met taking into account the predicted thermal and thermo-mechanical response of the host rock, and surrounding strata, and ground water system. [MGDS-RD 3.7.3.4.C][10 CFR 60.133(i)]"

"3.2.3.4 ENGINEERED BARRIER SEGMENT - WASTE ACCEPTANCE
INTERFACE REQUIREMENTS

....
A. WA will provide standard HLW meeting the following criteria:

....
1.e. Total heat generation rate: Up to 1500 watts per canister (TBV) at the year of shipment.

- 1.f. Waste temperature: Will not have exceeded 400°C (TBV) during transit to ensure the glass transition temperature was not exceeded. [MGDS-RD 3.2.3.2.2.B.1]

....
C. WA will provide standard SNF meeting the following criteria:

- 1.b. Cross-section: 6 inches x 6 inches or less for BWR and 9 inches x 9 inches or less for PWR (TBV). [MGDS-RD 3.2.3.2.2.A.1][10 CFR 961.11, App. E, B.1]

- 1.d. Cooling: The minimum cooling time for fuel is five (5) years. [MGDS-RD 3.2.3.2.2.A.1][10 CFR 961.11, App. E, B.3]

- 1.f. Consolidated Fuel Rods: Fuel which has been disassembled and stored with the fuel rods in a consolidated manner shall be classified as Nonstandard Fuel Class NS-5. [MGDS-RD 3.2.3.2.2.A.1][10 CFR 961.11, App E., B.5]

- 2. Temperature will not have exceeded 350°C (TBV) during storage under inert gas. [Derived]"

"3.7 ENGINEERED BARRIER SEGMENT MAJOR COMPONENT CHARACTERISTICS/REQUIREMENTS

The major components of the Engineered Barrier Segment are the waste packages, the underground facility, any backfill placed in the emplacement drifts, and any emplacement hardware provided to support and protect the emplaced waste package. (The underground facility portion of the Engineered Barrier Segment and the associated requirements allocated to the EB-DRD by the MGDS-RD are identified as interfaces with the Repository Segment in Section 3.2.3.3.) These major components shall be capable of contributing to the assigned function, Isolate Waste (1.4.3), by containing waste in the waste package during the containment period of 300 to 1,000 years (TBR), and then by limiting the release of radionuclides during the post-containment period. [MGDS-RD 3.7.3.1.A, B] [CRD 3.7.4.1.1]

-
G. To limit the predicted thermal and thermo-mechanical response of the host rock and surrounding strata, and groundwater system, the Engineered Barrier Segment configuration and loading shall:

1. Limit borehole wall temperature (if a borehole is used) to 275°C (TBV)
2. Limit the maximum temperature 1 meter into the rock to 200°C (TBV)
3. Limit the TSw3 (vitrophyre tuff) maximum temperature to 115°C (TBV)
4. Limit the maximum ground surface temperature change in the vicinity of the repository to 6°C (TBV)
5. Limit the emplacement drift maximum temperature to 100°C (TBV)
6. Limit the access drift maximum temperature to 50°C (TBV)

[MGDS-RD 3.7.3.4.C] [10 CFR 60.133(i)]"

"3.7.1

WASTE PACKAGE SUBSYSTEM REQUIREMENTS

....

- B. The design of waste packages shall include, but not limited to, consideration of the following factors: solubility, oxidation/reduction reactions, corrosion, hydriding, gas generation, thermal effects, mechanical strength, mechanical stress, radiolysis, radiation damage, radionuclide retardation, leaching, fire and explosion hazards, thermal loads, and synergistic interactions.

[MGDS-RD 3.7.3.3.B] [10 CFR 60.135(a)(2)]"

"3.7.1.3

INTERNAL STRUCTURE REQUIREMENTS

....

- G. The internal structure shall maintain functionality under the thermal and chemical conditions generated by the waste form.
[Derived]"

"3.7.2

BACKFILL REQUIREMENTS

....

- C. The transfer of heat from the waste package to the geologic setting by the backfill material shall not have an adverse effect on the long term performance of the WP.
[Derived]

-
- F. The chemical and mechanical stability of the backfill when subjected to the maximum thermal environment anticipated in the repository shall not have an adverse effect on the long term performance of the waste package. [Derived]"

4.2.3 WPIP Criterion for Thermal Design

The impetus to perform thermal evaluations of the waste package and near-field is provided by the Waste Package Implementation Plan (WPIP, Ref. 5.10). Design goals and the activities supporting these goals are listed in the WPIP. The source of the design goals is, for the most part, the Engineered Barrier Design Requirements Document and for the remainder the design goals were selected based upon engineering judgement. Design goals related to thermal analysis are listed in Section 2.4 of the WPIP (p. 2-4; Ref. 5.10) and provide basic thermal criteria for the design of the EBS:

"2.4 DESIGN GOALS

- ...
- Center line fuel pin temperature limit of (to be determined (TBD)) °C
 - Rock wall temperature limit of (TBD) °C
 - Thermal loading of the repository (TBD)

...

The maximum temperature of the glass waste forms must be maintained below limits established for them. This limit is about 500°C (to be verified) for West Valley Defense High-Level Waste glass. The YMP and the glass producers have the responsibility to maintain the peak temperature below the transition temperature.

- ...
- Meet temperature limits for components
 - Provide for a range of thermal loads
 - Provide capability to adjust repository thermal loading after emplacement"

Activities to support the design goals related to thermal analysis are indicated in Sections 3.4, 4.5, and 5.1 of the WPIP (pp. 3-2, 4-31, and 5-1; Ref. 5.10):

"3.4 PERFORMANCE ALLOCATION

... Thermal analyses will be performed to determine the temperature profiles across the drifts for drift emplacement. Limited thermal analyses will also be

performed for the borehole emplacement modes, assuming various package sizes and thermal loadings. These analyses will permit the re-evaluation of the goals given in the SCP for performance measures. ..."

"4.5 ENVIRONMENTAL INFORMATION NEEDS

....

4.5.2 Hydrologic Properties

Determine hydrologic (and thermal) properties of the WP environment in order to:

- Develop comprehensive model of the thermal and hydrologic behavior of the waste package environment as a function of overall repository thermal loading and rock properties, including two phase fluid flow.
- Use the model to forecast the near field temperature and fluid flow; these near field parameters will be used by the M&O Waste Package Development, M&O PA, and LLNL to calculate/forecast the WP temperatures (surface and centerline) and the distribution of corrosion rates and package lifetimes (as input to the models determined by the chemical and mineralogical properties investigation described above)."

"5.1 WP/EBS DESIGN ACTIVITIES

....

2. Thermal Evaluation (time dependent)
 - 2.1. Internal
 - 2.1.1. SNF and HLW
 - 2.1.2. WP basket
 - 2.1.3. WP internal barrier(s)
 - 2.1.4. WP body
 - 2.1.5. Closure
 - 2.2. External, EBS and near field
 - 2.3. Receipt rate and thermal variability"

4.2.4 Thermal Goals for EBS Design

Based on Assumption 4.3.1, the requirements of Section 3.7.G of the EBD RD (Ref. 5.5), and the design goals of the WPIP (Ref. 5.10), the following thermal criteria are established for the design of the EBS:

- Keep the rock mass temperature at 1 meter from a vertical borehole less than 200°C.

- Keep the emplacement drift wall temperature less than 200°C.
- Limit the TSw3 (basal vitrophyre) maximum temperature to less than 115°C.
- Limit the maximum ground surface temperature change in the vicinity of the repository to less than 2°C.
- Limit the emplacement drift maximum temperature for borehole emplacement to less than 100°C.
- Limit the access drift wall rock maximum temperature to less than 50°C during preclosure.
- Limit the CHn maximum temperature to less than 115°C.
- Limit the PTn (Upper Paint Brush non-welded) maximum temperature to less than 115°C.
- Limit the SNF cladding maximum temperature to less than 350°C.
- Limit the high-level waste glass maximum temperature to less than 500°C.
- The structural strength of any material component of the waste package shall not be compromised by temperature/environment of the EBS environment.
- Maximize the time the waste package container stays above boiling consistent with the thermal strategy developed.

The above thermal criteria are in addition to those previously quoted from the EBDRD (Ref. 5.5).

4.2.5 Thermal Goals/Criterion Addressed by this Analysis

Based on Assumption 4.3.1, the requirements listed in the previous sections, and the design goals of the WPIP (Ref. 5.10), the following thermal criteria are to be addressed by this analysis:

- Limit the SNF cladding maximum temperature to less than 350°C.
- The structural strength of any material component of the Waste Package shall not be compromised by temperature/environment of the EBS environment.

Originator: Thomas L. Lotz	Checker: Robert H. Bahney III
-----------------------------------	--------------------------------------

4.3 Assumptions

All assumptions identified in this section will require verification (or superseding assumptions) as the waste package design proceeds and should be treated as TBV items for preliminary design. For Pre-title II design (conceptual or preliminary) and documents not subject to 3 series QAPs, assumptions are identified and documented, but they are not subject to tracking in accordance with MGDS NLP-3-15.

4.3.1 The following thermal criteria are assumed to apply to the design of the Engineered Barrier Segment. These criteria are consistent with current program decisions in the Controlled Design Assumption Document (CDA, Ref. 5.7). The criteria are originally based on a reevaluation of the Site Characterization Plan (SCP) thermal goals (Table 3, p. 22, Ref. 5.33). Each thermal criterion is listed here followed by its CDA or SCP reference. This assumption is used in Section 4.2. As specified in Section 4.2.5, only the 350°C SNF cladding temperature and the material structural strength criteria are used directly for this analysis. These two criteria are used throughout Section 7. However, the other listed items are used in reference 5.13 and were used to generate the waste package surface boundary condition used for this analysis. They are listed here in the interests of consistency.

- Keep the rock mass temperature at 1 meter from a vertical borehole less than 200°C. (CDA EBD RD 3.7.G.2, p. 6-76, Ref. 5.7)
- Keep the emplacement drift wall temperature less than 200°C. (CDA EBD RD 3.7.G.2, p. 6-76, Ref. 5.7)
- Limit the TSw3 (basal vitrophyre) maximum temperature to less than 115°C. (CDA EBD RD 3.7.G.3, p. 6-77, Ref. 5.7)
- Limit the maximum ground surface temperature change in the vicinity of the repository to less than 2°C. (CDA EBD RD 3.7.G.4, p. 6-78, Ref. 5.7)
- Limit the emplacement drift maximum temperature for borehole emplacement to less than 100°C. (CDA EBD RD 3.7.G.5, p. 6-79, Ref. 5.7)
- Limit the access drift wall rock maximum temperature to less than 50°C during preclosure. (CDA EBD RD 3.7.G.6, p. 6-80, Ref. 5.7)
- Limit the CHn maximum temperature to less than 115°C. (CDA DCSS 025, p. 6-155, Ref. 5.7)
- Limit the PTn (Upper Paint Brush non-welded) maximum temperature to less than

Originator: Thomas L. Lotz	Checker: Robert H. Bahney III
-----------------------------------	--------------------------------------

115°C. (CDA DCSS 031, p. 6-160, Ref. 5.7)

- Limit the SNF cladding maximum temperature to less than 350°C. (CDA DCWP 001, p. 6-165, Ref. 5.7)
- Limit the high-level waste glass maximum temperature to less than 500°C. (CDA DCWP 002, p. 6-166, Ref. 5.7)
- The structural strength of any material component of the waste package shall not be compromised by temperature/environment of the EBS environment. (derived from p. 2-4, Ref. 5.10, and EBD RD 3.7.1.3.E, p. 3-53, Ref. 5.5)
- Maximize the time the waste package container stays above boiling consistent with the thermal strategy developed. (Table 3, p. 23, Ref. 5.33)

4.3.2 Two primary high thermal loadings (100 MTU/acre and 83 MTU/acre) and a couple variations of a low thermal loading (25 MTU/acre) will be considered in this analysis. These values are consistent with the range of thermal loadings (20 - 100 MTU/acre) given in the CDA (Key 019, p. 6-24, Ref. 5.7). Also, in an effort to have all of the M&O analysts on the same "sheet of music", thermal loadings of 25 and 83 MTU/acre were recommended in a Systems Engineering interoffice correspondence (p. 2, Ref. 5.23). A thermal loading of 100 MTU/acre represents the likely maximum possible without violating thermal goals according to the FY 93 Thermal Loading System Study (p. 10-2, Ref. 5.24) and is a bounding case for this analysis. This assumption is used in Section 7.1.

4.3.3 The waste package will be emplaced in-drift in a horizontal mode. This is consistent with large waste packages such as the MPC with disposal container and is a current program decision (CDA Key 011, p. 6-18, Ref. 5.7). This assumption is used throughout Section 7.

4.3.4 Reference 5.28 (Table 12, page 24) determined the thermal design basis BWR SNF for the MGDS waste package to have the following characteristics: 1) an age (or cooling time) of 10 years at the time of emplacement, 2) a burn up of 49,000 MWd/MTU, and 3) average assembly uranium enrichment of 3.74%. To complete the characterization of the BWR SNF, it is assumed that a GE-7 8x8 SNF assembly with a uranium mass of 0.200 MTU/assembly and an active fuel length of 150 inches will adequately represent the BWR SNF as a class of waste. This data is required in order to determine the decay heat curve of the MGDS thermal design basis BWR SNF. Based upon data from pages 2A-21 through 2A-22 of reference 5.12 and page 26 of reference 5.39, 0.200 MTU/assembly and an active fuel length of 150 inches was selected to conservatively bound the BWR assembly types given the wide variety of uranium loading configurations. This assumption is used throughout Sections 6 and 7.

- 4.3.5 The decay heat curve for the MGDS thermal design basis was generated with the use of the PHIA 00B code with data input from Attachment 2 of reference 5.30. The data from reference 5.30 is assumed to accurately represent the SNF currently in storage through out the United States. Use of the data from reference 5.30 is consistent with the reasons for its creation. This assumption is used throughout Section 7. The PHIA 00B code is presented in Attachment I and the data used from reference 5.30 as input to the PHIA 00B code is presented in Attachment II. The decay heat curve is presented in Sections 6.0 and 7.4.
- 4.3.6 The material properties, i.e., effective thermal conductivities, developed for the B&W 15x15 PWR SNF in reference 5.11 may be conservatively applied to the GE-7 8x8 BWR SNF for this analysis. The basis for this assumption is that the dominant mode of heat transfer from SNF to the basket is radiation. The BWR bundle has larger view factors to the waste package basket for the center rods of an assembly than the PWR counterpart. Thus, it is expected that the BWR SNF assembly will dissipate heat more efficiently than the PWR SNF assembly. Therefore, using the PWR effective conductivity material properties for the BWR SNF assembly is expected to over predict the BWR SNF cladding temperatures. Also, the use of data from reference 5.11 requires that the heat generation be homogenous in the modeled SNF region. Heat generation in SNF regions must be applied in this fashion to use the reference 5.11 data in a consistent manner. This assumption is used throughout Section 7.
- 4.3.7 The MPC with disposal container model assumes that a two dimensional finite element model of a cross section at the midsection of the waste package will be representative of the hottest portion of the waste package. Inherent in this assumption is that axial heat transfer does not significantly affect the solution. (i.e., the flow of heat in the radial direction is assumed to dominate the solution.) The basis for this assumption is that the metal thermal conductivities and heat generation distributions are such that axial heat transfer is very small or negligible. This was shown by the analysis in reference 5.13 which modeled the waste package in three dimensions. This assumption is used throughout Section 7.
- 4.3.8 For the cross section model of the waste package, an axial power peaking factor of 1.40 is applied to the BWR SNF heat generation rate. This factor is based upon the data in Appendix E of reference 5.34 and is assumed to bound the range of axial power peaking factors for BWR SNF. The basis for this assumption is that BWR reactor cores are designed such that axial peaking larger than 1.40 are typically not allowed. This assumption is used throughout Section 7.
- 4.3.9 The average waste package surface temperatures (time dependent), as defined in reference 5.13 for each thermal load case, will be applied as the boundary conditions for the detailed waste package analysis (normal conditions). The detailed waste package model

will examine the design basis SNF rather than the average SNF which will result in slightly higher near field temperatures. This effect, however, will be assumed to have a small impact upon the SNF cladding temperatures calculated and will be neglected. The basis for this assumption is engineering judgement. This assumption is used throughout Section 7.

- 4.3.10 The effects of drift backfilling will not be considered for the repository base case analysis. Backfill material has not been defined to date and will not be considered to be within the scope of this analysis. Backfill effects on the waste package design will be addressed in a different analysis. This assumption is used throughout Section 7.
- 4.3.11 The MPC conceptual design as presented on pages II.A.4-13 and II.A.4-14 of reference 5.8, Figures 4.2.1.2-1 and 4.2.1.2-2, are assumed to be the representative design which specifies the geometry and materials of construction. The basis of this assumption is that the specified reference is the only MPC design available. This assumption is used throughout Section 7.
- 4.3.12 The waste package disposal container material composition, geometry, and dimensions are assumed to be those specified in reference 5.31. This data is also presented as Waste Package Development sketches which are identified as specified in references 5.35 and 5.37, and are based upon reference 5.31. This assumption is consistent with CDA KEY 042, page 6-37 of reference 5.7. This assumption is used throughout Section 7.
- 4.3.13 The MPC waste package is assumed to be evacuated and filled with helium gas. The basis for this assumption is that this process is considered on pages II.A.3-20, II.A.3-53, and II.A.4-2 of reference 5.8 as a method to meet the internal humidity requirement for the MPC internals. This assumption is used throughout Section 7.
- 4.3.14 The gap between the MPC and the disposal container is assumed to be modeled conservatively if it is modeled as being void of material (i.e., a vacuum). The basis for this assumption is as follows: this space will most likely be evacuated and backfilled with helium gas for similar reasons as specified in assumption 4.3.13 for the MPC internals. However, since helium has a reasonably good thermal conductivity, assuming a vacuum will result in slightly higher internal temperatures. This is conservative for this analysis. This assumption is equivalent to assuming only radiative heat transfer between the MPC shell and the disposal container. This assumption is used throughout Section 7.
- 4.3.15 Modeling only conduction and radiative heat transfer is assumed to provide conservative results for this analysis. The basis for this assumption is as follows: convective heat transfer will occur with the fill gas which is placed internal to the MPC, however, the natural convective heat transfer will have a small or negligible contribution to the total heat transfer (see reference 5.16 for a discussion on natural convection heat transfer).

Thus, the problem may be modeled with only the dominant heat transfer modes with a negligible or conservative impact upon the results. This assumption is used throughout Section 7.

- 4.3.16 It is assumed for this analysis that the waste package with disposal container will not have filler material placed in side of it. The basis for this assumption is that the consideration of filler material is beyond the scope of this analysis. Evaluation of effect of filler materials will be evaluated with additional analysis at a later time. This assumption is used throughout Section 7.
- 4.3.17 It is assumed for this analysis that the waste package with disposal container will not be individually fitted with radiation shielding. This is consistent with the CDA; KEY 031, page 6-32, of reference 5.7. This assumption is used throughout Section 7.
- 4.3.18 It is assumed for this analysis that the waste package with disposal container will not contain consolidated SNF rods, but will only contain intact SNF assemblies. See KEY 008 on page 6-15 of reference 5.7 for the justification of this assumption. This assumption is used throughout Section 7.
- 4.3.19 It is assumed for this analysis that waste package materials which are in contact that a perfect weld will be modeled. This means that a contact thermal resistance will not be modeled between touching materials. This assumption is intended to make the modeling of the problem simpler and is judged to have a negligible impact upon the results of this analysis and any non-conservative impact will be more than offset by the conservatism in the other assumptions used for this analysis. The basis for this assumption is engineering judgement. This assumption is used throughout Section 7.
- 4.3.20 Modeling the MPC container as "floating" in the disposal container such that the MPC package does not touch the disposal container at any point is assumed to provide conservative results for this analysis. The basis for this assumption is engineering judgement. The assumption is conservative with respect to MPC internal temperatures since the modeled geometry eliminates any conduction heat transfer and will limit the mode of heat transfer to only radiation between two surfaces. This assumption is used throughout Section 7.
- 4.3.21 Modeling the MPC basket as "floating" in the MPC container such that the SNF tubes do not touch the MPC corner guides or any other part of the MPC is assumed to provide conservative results for this analysis. The basis for this assumption is engineering judgement. This is conservative with respect to SNF temperatures since the modeled geometry will eliminate any conduction heat transfer, other than that of conduction through the helium fill gas, from the SNF basket to the MPC shell and limits the main heat transfer mode to that of radiative heat transfer. This configuration uses the

Originator: Thomas L. Lotz	Checker: Robert H. Bahney III
-----------------------------------	--------------------------------------

manufacturing tolerances for the MPC container and creates a basket/shell gap. This assumption is used throughout Section 7.

- 4.3.22 The properties of helium at atmospheric pressure are assumed to be representative of the conditions which helium in the MPC will experience. This assumption is based upon the fact that a one atmosphere fill pressure is representative of industry standard for storage casks. Page 10 of reference 5.36 provides the highest pressure which storage casks are filled as approximately 1.5 atmosphere; also most industry vendors use substantially less pressure in their designs. Use of one atmosphere is representative of the most likely to be used. This assumption is used in Section 4.1 and throughout Section 7.
- 4.3.23 Use of the material properties for Stainless Steel 316 provided in Tables 4.1-1 and 4.1-2 is assumed to adequately represent any stainless steel used in the MPC package for this analysis. Particularly the use of a constant value for the density and emissivity is assumed to be adequate for this analysis. The basis for this assumption is engineering judgement and the fact that the temperature dependent values of thermal conductivity and specific heat are specified well enough to cover the anticipated temperatures the MPC is expected to experience. Also, the values for density and emissivity change only slightly over the expected range of temperatures. Thus, using a single value will not affect the results of the analysis. This assumption is used in Section 4.1 and throughout Section 7.
- 4.3.24 Use of the material properties for A 516 carbon steel provided in Tables 4.1-3 and 4.1-4 is assumed to adequately represent A 516 carbon steel for this analysis. Particularly the use of a constant value for the density and emissivity is assumed to be adequate for this analysis. The basis for this assumption is engineering judgement and the fact that the temperature dependent values of thermal conductivity and specific heat are specified well enough to cover the anticipated temperatures the MPC is expected to experience. Also, the values for density and emissivity change only slightly over the expected range of temperatures. Thus, using a single value will not affect the results of the analysis. This assumption is used in Section 4.1 and throughout Section 7.
- 4.3.25 Use of the material properties for Alloy 825 provided in Tables 4.1-5 and 4.1-6 is assumed to adequately represent Alloy 825 for this analysis. Particularly the use of a constant value for the density and emissivity is assumed to be adequate for this analysis. The basis for this assumption is engineering judgement and the fact that the temperature dependent values of thermal conductivity and specific heat are specified well enough to cover the anticipated temperatures the MPC is expected to experience. Also, the values for density and emissivity change only slightly over the expected range of temperatures. Thus, using a single value will not affect the results of the analysis. This assumption is used in Section 4.1 and throughout Section 7.
- 4.3.26 Use of the material properties for aluminum-boron provided in Table 4.1-8 and Section

4.1 is assumed to adequately represent aluminum-boron for this analysis. Particularly, the use of a constant value for the density and the use of the constant value of aluminum emissivity is assumed to be adequate for this analysis. The basis for this assumption is engineering judgement and the fact that the temperature dependent values of thermal conductivity and specific heat are specified well enough to cover the most of the anticipated temperatures the MPC is expected to experience. ANSYS does not extrapolate beyond the given tabulated values, rather it uses the last value available in the table. Thus, since thermal conductivity and specific heat generally increase with increasing temperature, ANSYS will use a conservative value if the aluminum-boron material experiences temperatures above 200°C. Also, the values for density and emissivity change only slightly over the expected range of temperatures. Thus, using a single value will not affect the results of the analysis. The use of aluminum emissivity for the aluminum-boron material is assumed reasonable in the absence of data for aluminum-boron since, for the MPC, the aluminum-boron material is clad in stainless steel and has only a minor edge exposed for the outer most tubes only. Finally, the emissivity for aluminum is sufficiently low at 0.07 that a lower value will have very little impact upon the solution and the results of the analysis will be conservative if the value for aluminum-boron is indeed larger. This assumption is used in Section 4.1 and throughout Section 7.

4.3.27 Use of the material properties for C71500 70/30 Copper-Nickel Alloy provided in Table 4.1-9 is assumed to adequately represent C71500 70/30 Copper-Nickel Alloy for this analysis. Particularly the use of a constant value for the density and specific heat is assumed to be adequate for this analysis. The basis for this assumption is engineering judgement and the fact that the temperature dependent values for thermal conductivity are specified well enough to cover the anticipated temperatures the MPC is expected to experience. Also, the value for density changes only slightly over the expected range of temperatures. Thus, using a single value will not affect the results of the analysis. ANSYS does not extrapolate beyond the given tabulated values, rather it uses the last value available in the table. Thus, since specific heat generally increases with increasing temperature, ANSYS will use a conservative value for specific heat by using the C71500 70/30 Copper-Nickel Alloy specific heat at 20°C. This assumption is used in Section 4.1 and throughout Section 7.

4.3.28 The use of single, homogenized SNF material density used in conjunction with assumption 4.3.6 is assumed reasonable and adequate. The basis for this assumption is engineering judgement. The value used for SNF density is $0.388242 \times 10^4 \text{ kg/m}^3$. The density value was determined using the BWR assembly mass from Table 5.1.1.2.1-1 on page 26 of reference 5.39 of 730 lbs (331.126 kg) and dividing by the BWR assembly volume which provides an average density in kg/m^3 (Density = Mass / Volume). The BWR volume was determined using the overall assembly width of 5.44 inches (0.138 meters) and the assembly length of 175.87 inches (4.467 meters) from page 2A-21 of reference 5.12. The volume calculation is then simply that of the assembly width squared

multiplied by the assembly length (Volume = width x width x length). The SNF density used is: Density = Mass/Volume = 0.388242×10^4 kg/m³. This assumption is used throughout Section 7.

- 4.3.29 The use of single, homogenized SNF material specific heat used in conjunction with assumption 4.3.6 is assumed reasonable and adequate. The basis for this assumption is engineering judgement. The specific value was determined using: 1) the BWR assembly and uranium mass from Table 5.1.1.2.1-1 on page 26 of reference 5.39 of 730 lbs (331.126 kg) and 200 kg and 2) the specific heat of uranium oxide of 247 J/kg·K (100°C) and Zirc2 of 330.0 J/kg·K (400°C) from Tables 8-1 and 8-2 on page 296 of reference 5.1. The assembly is assumed to be comprised only of uranium oxide and zirc2, therefore the homogenized specific heat is a simple mass weighted average (i.e., $SNF C_p = (C_p UO_2 \cdot Mass UO_2 + C_p Zr2 \cdot Mass Zr2) / Mass \text{ of Assembly}$). The mass of UO₂ is determined from the mass of uranium (i.e., mass UO₂ = mass U · (Atomic wt U + 2 · Atomic wt of O¹⁶) / Atomic wt of U = 226.886 kg). The mass of Zirc2 is then simply the difference between the total assembly mass and the UO₂ mass (mass Zr2 = 104.240 kg). The SNF specific heat value is then calculated to be: SNF C_p = 273.129 J/kg·K. The value used in each of the ANSYS input decks provided in Attachments XII through XVI is 284.01 J/kg·K and is in error. However, the error is judged to be small relative to the given set of assumptions and will have no impact upon any of the results given the small amount of thermal energy mass storage expected in the homogeneous SNF assembly. This assumption is used throughout Section 7.

4.4 Codes and Standards

Not Applicable. Thermal design of the waste package is not controlled by codes and standards. The American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code (Ref. 5.15) has been used only as a source of material properties.

6. Use of Computer Software

The FEA analysis computer code used for this analysis is ANSYS V5.0A which is identified with the Computer System Configuration Identifier (CSCI) B00000000-1717-1200-30003. ANSYS is a commercially available finite element thermal and mechanical analysis code and is appropriate for the thermal analysis of waste packages, waste package emplacements, and waste package environments. The analyses using the ANSYS software were executed on a Hewlett-

Originator: Thomas L. Lotz	Checker: Robert H. Bahney III
-----------------------------------	--------------------------------------

Packard 9000 Series 735 workstation. The software qualification of the ANSYS software, including problems of the type analyzed in this report, is summarized in the ANSYS V5.0A Verification and Validation Final Report (page 1, Ref. 5.25). The ANSYS evaluations performed for this design are fully within the range of the validation performed for the ANSYS V5.0A code. Access to and use of the code for the analysis granted and performed in accordance with the ANSYS V5.0A Life Cycle Plan (page 1, Ref. 5.26) and the QAP-SI series procedures. Inputs and outputs to the ANSYS software are included as attachments as described in the following design analysis.

The ANSYS SNF heat load file was generated with the computer code PHIA V00B and is classified as computational support software. PHIA V00B is not a controlled computer code and has not been qualified under the QAP-SI series of M&O procedures. PHIA requires the data provided in assumptions 4.3.4 and 4.3.5 as inputs. Based upon the data provided in assumption 4.3.4, PHIA performs a table look up using the data set of assumption 4.3.5. Once the proper sub-set of data is obtained, PHIA then will interpolate data points in order to generate an ANSYS usable data file. The PHIA code listing, input database file, and ANSYS data file are provided as Attachments I, II, and III. The PHIA code is simply an automation of a simple data manipulation which can easily be checked by hand. The data is provided in this analysis for the purpose of performing hand calculation checks. The data manipulation has been checked by hand, and will be used in this analysis on that basis. The PHIA code was utilized for the purpose of computational support software as it was intended and it is appropriate for the use of generating a ANSYS SNF heat load file. The PHIA software was executed on a IBM PC compatible.

The Wooton-Epstein correlation calculation was performed with the computer code Lotus 1-2-3 for Windows Version 1.1 and is classified as computational support software. Lotus 1-2-3 for Windows Version 1.1 is not a controlled computer code and has not been qualified under the QAP-SI series of M&O procedures and will not be qualified under the M&O procedures. Lotus 1-2-3 for Windows Version 1.1 simply provides a frame work to automate a simple calculation which can easily be checked by hand. The input data and a description of the calculation performed is provided in Section 7.4 for the purpose of performing hand calculation checks. The calculation has been checked by hand and will be used in this analysis on that basis. Lotus 1-2-3 for Windows Version 1.1 was utilized for the purpose of computational support software as it was intended and it is appropriate for the use of generating peak cladding temperatures as specified in Section 7.4. Lotus 1-2-3 for Windows Version 1.1 was executed on a IBM PC compatible.

The presentation graphics provided in Section 7.4 was generated with the computer code Harvard Graphics Version 2.0 and is classified as computational support software. Harvard Graphics Version 2.0 was executed on a IBM PC compatible. Harvard Graphics Version 2.0 is not a controlled computer code and has not been qualified under the QAP-SI series of M&O procedures and will not be qualified under the M&O procedures. Harvard Graphics Version 2.0

simply provides a frame work to create a graphical representation of data. No calculation or modification beyond cut and paste operations with tabular ANSYS output or Lotus 1-2-3 was performed in Harvard Graphics.

7. Design Analysis

7.1 Background

As part of an engineered barrier system for the containment of radionuclides, the MPC WP must be shown to comply with all regulations and requirements that govern the conditions of the emplaced SNF and the near-field rock at the repository horizon. Temperatures in the WP and near-field host rock are key to radionuclide containment, as they directly affect oxidation rates of the metal barriers, metal and fuel cladding structural integrity, and the ability of the rock to impede particle movement.

Maximum allowable temperatures are based on material performance criteria and are specified as design goals for the WP/EBS design. For SNF, the Commercial Spent Fuel Management Program (p. xii, Ref. 5.27) at Pacific Northwest Laboratory recommended a 380°C temperature limit for the SNF cladding to prevent creep rupture failure. A more conservative value of 350°C has been selected (CDA DCWP 001, p. 6-165, Ref. 5.7) to account for uncertainties in source characteristics as well as heat transfer calculations. To limit the predicted thermal and thermo-mechanical response of the host rock and surrounding strata, maximum temperatures of 200°C for TSw2 (at the emplacement drift wall) and 115°C in the TSw3 (vitrophyre tuff) layer have been specified. Specific characteristics and requirements for the engineered barrier system are listed in the Yucca Mountain Site Characterization Project Engineered Barrier Design Requirements Document (Ref. 5.5) and are discussed in Section 4.2.

The method for WP thermal evaluations involves a three-model approach to determine the time-dependent WP thermal behavior. As presented in reference 5.13, a three-dimensional (3-D) transient finite element model of the WP emplacement provides the WP surface temperature history for use as a boundary condition. The WP boundary condition is then applied to a detailed two dimensional (2-D) WP model, it is this 2-D model which is analyzed in this report. Resulting SNF basket wall temperature predictions from the WP model provide the boundary for an estimation of peak SNF cladding temperatures. Cladding temperatures are predicted in the WP model using an effective conductivity defined to represent an homogeneous SNF assembly. The effective conductivity was determined using a detailed third model of an intact SNF assembly as presented in reference 5.11. Cladding temperatures are also conservatively estimated using an empirical correlation from reference 5.14.

The thermal environment of the WP in the repository will change with time and is affected by the heat produced in the WP. Therefore, the WP thermal evaluation must be a transient analysis that takes into account the time varying heat load of the WP. This can be contrasted to an SNF

storage cask analysis where the thermal environment is assumed constant and is provided by regulations.

To determine the effect of the WP on repository near-field temperatures, a 3-D emplacement model was evaluated for a range of thermal loadings. The analysis is described in detail in the supporting emplacement thermal model design analysis (Ref. 5.13). A parametric set of thermal loading cases, summarized in Table 7.1-1, is required because the thermal loading for the repository has been specified as a range in the Controlled Design Assumptions Document (CDA) (Key 019, p. 6-24, Ref. 5.7) and the MPC must be shown to meet requirements over that range. Representative "high" and "low" thermal loadings of 100 MTU/acre (24.7 kg U/m²), 83 MTU/acre (20.5 kg U/m²), and 25 MTU/acre (6.2 kg U/m²) were selected (see assumption 4.3.2) to be consistent with the CDA and the Thermal Loading Systems Study (Ref. 5.24), and drift spacings in multiples of 22.5 m (see ref. 5.13) were selected to be consistent with the Repository/WP Initial Summary Report (Ref. 5.29).

Table 7.1-1. Large Waste Package Thermal Loading Scenarios
(From Table 7.5-1 of Reference 5.13)

AML MTU/acre	Initial APD kW/acre	Waste Package Spacing	Drift Spacing
100 (high #1)	113.7	16.2 m	22.5 m
83 (high #2)	94.4	19.5 m	22.5 m
25 (low #1)	28.4	32.3 m	45.0 m
25 (low #2)	28.4	21.6 m	67.5 m
25 (low #3)	28.4	16.2 m	90.0 m

The low thermal loading drift spacings described in Table 7.1-1 represent the utilization of even multiples of the high thermal loading drift spacing (every other drift, every third, etc.). Low thermal loading #1 achieves the longest reasonable WP spacing and results in the lowest near-field temperatures; low thermal loading #2 has a WP spacing similar to that for the high thermal loading; and low thermal loading #3 has a short WP spacing and represents the "localized disturbance" concept for low loadings. The "localized disturbance" concept depends on high temperature gradients (due to the closely spaced WPs) to drive local water in the rock away from the emplacement drifts. The analysis performed in reference 5.13 was performed to determine the rock wall temperatures for these conditions and whether the rock temperature goals were met. The WP surface temperatures from that analysis can be used as a boundary condition to determine the WP internal and SNF cladding temperatures.

7.2 Design Basis Fuel

To capture a majority of the SNF, the WP must be designed and evaluated to accommodate the bounding or limiting case of fresh SNF which has a thermal output much higher than average. Thus, a design basis SNF can be determined which can be considered the hottest SNF that could be loaded and emplaced in that waste package. The detailed waste package/EBS evaluation would then represent the hottest waste package in a repository at a given thermal loading (with otherwise average SNF). While all of the waste packages (hot and cold) will collectively influence repository temperatures (average SNF characteristics), every waste package must meet thermal goals (design basis SNF characteristics). The methodology and selection of design basis SNF for WP design is covered in reference 5.28.

Given that higher capacity waste packages are more likely to exceed thermal goals than smaller ones in the same repository thermal environment, the choice of a design basis SNF is important because it could limit the number of assemblies that can be loaded in one WP without exceeding thermal goals for disposal. The limiting thermal goal for waste packages, such as the 40 BWR MPC, is a temperature of no more than 350°C at the SNF cladding. Several different design basis SNF types have been used in by the OCRWM to demonstrate compliance with requirements and to allow comparison with previous evaluations. Table 7.2-1 summarizes the SNF types used. The heat loads for each assembly type were interpolated from the database of spent fuel characteristics for each of the assumed design basis SNF types (Ref. 5.30) using the PHIA00B code (see attachment I).

Table 7.2-1. Thermal Analysis SNF Design Bases

Organization	SNF Type	SNF Age	SNF Burnup	Initial Heat
MGDS (Ref. 5.28)	PWR	10 years	48 GWd/MTU	850 watts
MGDS (Ref. 5.28)	BWR	10 years	49 GWd/MTU	409 watts
MPC (Ref. 5.39)	PWR	20 years	40 GWd/MTU	547 watts
MPC (Ref. 5.39)	BWR	20 years	40 GWd/MTU	265 watts
MPC Historic (Ref. 5.8)	PWR	10 years	40 GWd/MTU	718 watts

Design basis SNF will impact the timing of peak temperatures as well as the magnitude of the peak. The repository host rock temperatures will peak between 10 to 500 years depending on the thermal loading but will be largely independent of the individual waste package design. The waste package itself will experience its peak temperature before the rock temperature peaks. The peak temperature and its timing will depend on the design basis SNF and the basket/container design. In previous analyses of the large waste package (p. 6-108, ref. 5.29), higher conductivity

SNF baskets were seen to lower and delay the peak temperatures experienced. The choice of the design basis SNF is of key importance. Younger SNF types produce high peak temperatures within the first year which then drop off quickly. Older SNF (at the same initial APD, but not AML) produces lower and later peaks with more stable and higher long-term temperatures.

In the following evaluation, only the MGDS design basis BWR SNF type has been used to illustrate the cladding temperatures which the MPC will produce when placed in the MGDS. The time dependence of the design basis BWR SNF heat load is provided in Appendix III as provided by the PHIA code using the data provided in Attachment 2 of reference 5.30. The PHIA code uses the data provided in assumption 4.3.4 and 4.3.5, sorts through the SNF decay heat data to obtain the correct heat generation rate versus time for the given SNF parameters, then interpolates as required to obtain the desired ANSYS time step intervals. The data is then written to an output file suitable for direct use by ANSYS. The PHIA code is provided as Attachment I, along with the input file from reference 5.30 as Attachment II, and the output file from PHIA as Attachment III.

7.3 2-D Waste Package Model Development

The general philosophy used for this analysis is to create a separate input file for each thermal loading case. Since there are only two major differences between individual cases, i.e., boundary condition and outer barrier for high and low thermal load, a base deck (High Thermal Load #1 Case) was created with the basic modeling information. The base deck was then copied for each ANSYS case. Each individual file then had the appropriate boundary condition file from reference 5.13 entered into the input decks. Finally, the Low Thermal Load cases then had the appropriate outer barrier material and thickness data entered into the input decks.

The basic lay out of each deck follows the following pattern: 1) comment header used to define problem modeled, additional files read by the input deck, and what information is contained in the data files used in the input deck. 2) Define model parameters and dimensions which are used repeatedly. This includes all material properties, reading of boundary condition files, reading of body load files, etc. The ANSYS input decks make use of defined variables which are then used to perform simple calculations concerning units conversions and geometric positions. Many of the MPC basket geometry parameters are reported in reference 5.8 in units of inches. These values were entered into the ANSYS input decks along with the units conversion to meters, assigned a variable name, and the variable name was then used through out the remainder of the input deck to determine the geometry of the basket and the disposal container. Also, units of years are used in the file defining SNF heat loads. The years are converted to seconds for this analysis. The variables are clearly identified and defined via comments included in the ANSYS input deck. 3) Define element types which will be used to perform the solution. 4) Define the model geometry and mesh structure. The approach used is to define all components by first defining the basic key points, then lines, then areas and finally the mesh. Long winded, but it

is easily followed and repeated. 5) Define all radiation surfaces and create radiation mesh matrix. The ANSYS AUX12 utility is used to generate all of the required view factors between radiation elements. 6) Apply the body loads and boundary conditions (B.C.'s) to the appropriate geometry components. Since this calculation is a transient, the loads and B.C.'s are applied at each time step. 7) Finally, selected positions in the SNF, basket, MPC shell, and disposal container were selected to have temperatures for each time step of the transient echoed to the output file for examination.

Each ANSYS input deck is provided as part of the ANSYS output files in Attachments XII, XIII, XIV, XV, and XVI. Heat and material input files are provided as Attachments III, IV, V and the boundary condition files for each thermal loading case is provided in Attachments VII through XI.

The development of any ANSYS model involves the following specific steps:

- 1) Identify the geometry to be modeled.
- 2) Identify the material properties which will be required.
- 3) Identify the assumptions used to model the real geometry and materials.
- 4) Identify the body loads (i.e., heat generation rates in specific materials)
- 5) Identify the boundary conditions/surface loads (i.e., surfaces with known or given temperatures.)
- 6) Specify the problem as steady state or transient. If transient specify the time frame which is to be considered.
- 7) Execute the model generated to obtain solutions for the given conditions.
- 8) Analyze the results to form a conclusion or support an design thesis.

The creation of an ANSYS model for the 40 BWR MPC conceptual design followed the listed steps. Discussion of some of these steps will be combined for convenience.

- 1) Identify the geometry to be modeled.
- 2) Identify the material properties which will be required.

The geometry and the material composition of each component is specified in reference 5.8 (Section 4.2.2.2) for the 40 BWR MPC conceptual design and references 5.31, 5.35, and 5.37 for the disposal container (see assumptions 4.3.11 and 4.3.12). Notice that the high thermal load and low thermal load waste packages have different outer barrier thicknesses and material compositions. The high thermal loading disposal container is 0.020 meter thick Alloy 825 with an outer barrier of 0.100 meter thick alloy A 516 carbon steel. The low thermal loading disposal container is 0.020 meter thick Alloy 825 with an outer barrier of 0.050 meter thick C71500 copper-nickel alloy.

Since this model is part of a larger calculational scheme as indicated in references 5.11 and 5.13, a simple 2-D cross section of the MPC with waste package will be modeled (see assumption 4.3.7). A vertical plane of symmetry is easily identified and thus, the geometry modeled will be that of the right hand side of the MPC with disposal container. The geometry is not modeled with quarter symmetry since the boundary condition, as specified in reference 5.13, indicates a vertical surface temperature distribution and requires half symmetry. Attachment VI provides mesh plots of the general lay out of the waste package internals.

Material properties to be used for each component of the design are specified in Section 4.1 along with the references from which they were obtained. The ANSYS file containing this material property data is provided as Attachment IV (see assumptions 4.3.22, 4.3.23, 4.3.24, 4.3.25, 4.3.26, and 4.3.27). The effective conductivity of the SNF assembly model areas were developed in reference 5.11 and are provided as Attachment V. The additional properties were developed in Section 4.3 (see assumptions 4.3.6, 4.3.28, and 4.3.29) and entered into the input deck. Attachment IV also includes material properties which were not used in this analysis (i.e., those identified as material ID's 4, 5, 6, 8, 9, 10, 11, and 12 were not used).

3) Identify the assumptions used to model the real geometry and materials.

All assumptions used for this ANSYS model are listed in Section 4.3. These assumptions provide all of the required insight for a competent ANSYS user as to why the ANSYS geometry and material selections were entered into the ANSYS input decks in the given fashion. (Including assumptions 4.3.3, 10, 13, 14, 15, 16, 17, 18, 19, 20, 21)

- 4) Identify the body loads (i.e., heat generation rates in specific materials)
- 5) Identify the boundary conditions/surface loads (i.e., surfaces with known or given temperatures.)
- 6) Specify the problem as steady state or transient. If transient specify the time frame which is to be considered.
- 7) Execute the model generated to obtain solutions for the given conditions.

The material which carries the heat load is the SNF and is modeled as a solid material placed in the interior of each tube. The heat load is dependant upon the design basis SNF selected and is discussed in Section 7.2. Briefly, the heat loads for the SNF areas were interpolated from the data provided in reference 5.30 for the assumed MGDS design basis SNF type. The heat load will decrease logarithmically with time as the fission products decay and therefore was created as a function of time. The heat loads were applied volumetrically and were multiplied by an axial heat peaking factor of 1.40 to approximate the axial center of the WP with a 2-D model (see assumption 4.3.8). A SNF assembly is much hotter at the mid-length than at the ends, and it is conservative to assume the 2-D waste package model represents the hottest cross-section of the MPC/waste package.

As indicated in section 7.1, this analysis is part of a three part calculation method. As such the boundary conditions are provided by the calculations performed in reference 5.13. The boundary conditions for each repository thermal loading scenario was applied to the waste package surface as a temperature requirement to create five ANSYS decks (see assumption 4.3.9). The boundary conditions are time dependent, the SNF heat generation rate is also time dependent, and therefore the problem is a transient. The boundary conditions and heat loads were applied and solved out to 1000 years for each of the five thermal loading scenarios described in Section 7.1 and for the BWR MGDS design basis SNF type described in Table 7.2-1. The transient time of 1000 years was performed to be consistent with the analysis performed in reference 5.13.

8) Analyze the results to form a conclusion or support an design thesis.

The results of each ANSYS execution are provided as Attachments XII through XVI. Discussion and summary of the ANSYS results are provided in Section 7.4 and conclusions are provided in Section 8.0. Notice that selected data was requested in the input deck and echoed into the output file for ease of use. This data is summarized in Section 7.4.

7.4 2-D Waste Package Analysis Results

All of the results provided in this section were derived from the ANSYS V5.0A executions. These models are presented in the ANSYS output files summarized in Section 9.0 and provided as attachments to this report. All of the assumptions concerning geometry, material composition, boundary conditions, and other inputs are provided in Section 4.3.

To check the above SNF model preliminary results, the Wooton-Epstein correlation (reference 5.14) was applied for each of the cases. This empirically derived correlation was shown to be conservative in Section 3.6.2 of the BR-100 Spent Fuel Shipping Cask report (reference 5.38). The Wooton-Epstein relationship is described by Equation 7-1.

$$q'' = \sigma \frac{C_1}{\frac{1}{\epsilon_{cl}} + \frac{1}{\epsilon_{ba}} - 1} (T_{cl}^4 - T_{ba}^4) + C_2 (T_{cl} - T_{ba})^{\frac{4}{3}}$$

(Equation 7-1)

Where:

q''	= heat flux from SNF based on the basket inner surface heat transfer area (Btu/hr-ft ²)
C_1	= constant depending on the spent fuel rod array size, = $4N/(N+1)^2$ for odd N = $4/(N+2)$ for even N
C_2	= regression constant = 0.118
N	= number of fuel pins in a single row of a square spent fuel assembly
T_{cl}	= cladding surface temperature (absolute scale, °R)
T_{ba}	= basket surface temperature (absolute scale, °R)
ϵ_{cl}	= cladding surface emissivity
ϵ_{ba}	= basket surface emissivity
σ	= Stefan-Boltzmann constant (Btu/hr-ft ² ·°R ⁴)

The relationship has two terms; one representing radiation heat transfer, and one representing gaseous convection in an array of heat producing rods. Because the cladding temperature occurs in both terms, the relation must be solved iteratively. A complete description of the correlation development is given in the Wooton-Epstein paper (reference 5.14). For this analysis, the same material properties and conditions were assumed with the Wooton-Epstein relation that were used in the ANSYS model (see assumption 4.3.4, 4.3.5, 4.3.6, 4.3.8, 4.3.16, 4.3.18, and 4.3.23):

Stefan-Boltzmann constant	1.714×10^{-9} (Btu/hr-ft ² ·°R ⁴)
Cladding emissivity	0.806 (0.002 inch oxidation layer, Ref.5.11)
Basket emissivity	0.600 (Stainless 316L)
Basket cell width	152.4 mm (6.0 inches)
SNF array size (N)	8 pins
Assembly active length	3810 mm (150.0 inches)
Axial peaking factor	1.40

The conservative peak cladding temperatures were calculated with the Wooton-Epstein correlation, the above values for required parameters, and the ANSYS calculated peak basket temperatures.

Tables 7.4-1 through 7.4-5 summarize the temperature data for each of the cases analyzed. Both "conservative" estimates of peak cladding temperatures using the Wooton-Epstein correlation, and "best estimate" predictions using the effective conductivity method are presented in the table. Peak cladding temperatures using effective conductivity are calculated directly in the ANSYS program, and Wooton-Epstein calculations for each time step in the ANSYS analysis were also performed for comparison.

The thermal history for each case is presented graphically in Figures 7.4-3 through 7.4-7 and Figures 7.4-1 and 7.4-2 graphically compares the peak cladding and waste package surface

temperatures for each case. The highest peak conservative estimate for SNF cladding temperature was 301°C which can be compared to the thermal goal of 350°C. The results show that a greater WP spacing results in lower near-field temperatures.

Peak temperatures inside the waste package occur between the time of emplacement and the time of peak drift wall temperatures. At emplacement the SNF heat load is at its highest, but the drift is still cool, and by the time of peak drift temperatures, the heat load has decayed so that internal temperature drops are lower. As indicated in Tables 7.4-1 through 7.4-5, the time of peak temperatures varies depending on thermal loading, WP spacing, and the time-dependent WP decay heat (SNF type). For most design basis SNF types, peak WP internal temperatures will occur in less than 2 years after emplacement even though waste package surface temperatures do not peak for 10 years or more. By 100 years, however, the temperature drop across the WP (from center to edge with the effective thermal conductivity model) has dropped to less than 50°C.

While 83 MTU/acre (Figure 7.4-4) is considered a more likely scenario for a high thermal loading, a higher thermal loading of 100 MTU/acre (Figure 7.4-3) was also evaluated to bound the WP internal temperatures for the full range of possible thermal loadings. The combination of short WP spacing and high thermal loading resulted in the highest temperature of all of the cases. SNF cladding temperatures peaked at 288°C (301°C for Wootton-Epstein Correlation) and average repository horizon temperatures remained above 150°C past 1000 years. Calculations at LLNL (Ref. 5.32) have shown that above boiling conditions will persist for thousands of years at AMLs in this range, however, some thermal goals are close to upper limits.

Figure 7.4-5 displays the thermal history of the 40 BWR MPC with disposal container at 25 MTU/acre (6.2 kgU/m²) with the long WP spacing (low thermal loading #1) for the MGDS design basis SNF. Peak internal temperatures are lowest of all the cases due to the long WP spacing.

Figure 7.4-6 displays the thermal history of the 40 BWR MPC with disposal container for low thermal loading #2 and for the MGDS design basis SNF. Because the WP spacing is similar to that for high thermal loading #2, similar temperatures are predicted for the first few years of emplacement. However, as thermal loading effects emerge, all of the low thermal loading results converge.

Figure 7.4-7 displays the thermal history of the 40 BWR MPC with disposal container for low thermal loading #3 and for the MGDS design basis SNF. The highest internal temperature for all cases occurred where the MGDS design basis SNF is used and the shortest WP spacing (16.2 m) defines the thermal loading. The peak temperatures occur before drift-to-drift effects emerge such that WP spacing drives the near-field temperatures and high thermal loading #1 and low thermal loading #3 have nearly the same peak cladding temperature.

8. Conclusions

Table 8-1 summarizes the peak temperatures and the time of occurrence for each of the cases analyzed. The thermal loading scenarios indicated in Table 8-1 are defined in Table 7.1-1, and the design basis SNF descriptions are provided in Table 7.2-1. Both "conservative" estimates of peak cladding temperatures using the Wooton-Epstein correlation and "best estimate" predictions using the effective conductivity method are presented in the table. Peak cladding temperatures using effective conductivity are calculated directly in the ANSYS program, and Wooton-Epstein calculations for each time step in the ANSYS analysis were also performed for comparison.

Table 8-1. 40 BWR MPC Thermal Analysis Results Summary

Thermal Load	Design Basis SNF	Peak Cladding				Peak Basket		MPC shell		WP Surface	
		Cons. Est.		Best Est.		°C	yrs	°C	yrs	°C	yrs
		°C	yrs	°C	yrs						
High #1	MGDS	301	2	288	2	280	3	213	30	188	50
High #2	MGDS	297	0.9	284	0.9	275	1	206	8	165	40
Low #1	MGDS	294	0.5	280	0.5	271	0.5	190	2	117	8
Low #2	MGDS	296	0.8	282	0.8	273	0.9	195	4	131	8
Low #3	MGDS	300	1	287	2	278	2	204	5	146	10

The repository thermal loading has not been specified by the MGDS program and will not be finally established for years. Therefore, the thermal evaluation of the 40 BWR MPC conceptual design with respect to the repository has considered a number of thermal loading scenarios. For each repository thermal loading scenario, a 3-D repository emplacement (reference 5.13) and 2-D waste package evaluation were performed. As indicated by the data provided in Table 8-1, the peak SNF cladding temperatures remain below 350°C and the temperatures for the materials used in the MPC conceptual designs are not such that melting or rapid mechanical failure would occur.

The results of the thermal evaluations indicate that the 40 BWR MPC with disposal container design can satisfy the thermal limitations (i.e., goals) specified in Section 4.2.5 during normal expected conditions for disposal in the MGDS and therefore has a reasonable chance to meet the MGDS requirements for permanent disposal. Thus, this MPC conceptual design may be used as a point of departure for analysis of designs put forth by the MPC manufacturers. However, two points should be noted: 1) more analysis is required to determine conditions for anticipated off-normal conditions, drift backfill, and for the MPC vendor specific designs and 2) this analysis relies on input data which is TBV. These items need to be addressed in

any work which utilizes these results.

9. Attachments

The attachments included are summarized in Table 9-1.

Table 9-1. Attachments of Supporting Documentation for the 40 BWR MPC MGDS Analysis

Attachment Number	Title / Description	# of Pages
I	PHIA Code Listing (File name: phia00b.cpp)	4

```

/*phia.cpp Package Heat Input to ANSYS. Calculates heat heat as a
function of age, burnup, and initial enrichment which are input by the user.
If the user enters the value 0 for initial enrichment, the program calculates
the average initial enrichment expected for the input value of burnup
(based on the actual and EIA forecast of fuel loading and discharge
characteristics). The heat is evaluated and output for a series of times
up to 10,000 years, pre-selected to be most appropriate for input to ANSYS
temperature calculations of the waste package emplaced in the repository.
The heat calculation is performed by interpolation in a table of heat values
for specified values of age, burnup, and initial enrichment for both PWR
and BWR fuel types.

TITLE=
40 BWR MPC/Waste Package with 10 yr old, 49 GWD/MTU SNF

SI UNITS SPECIFIED

LENGTH = METERS(M)
MASS = KILOGRAMS(KG)
TIME = SECONDS(SEC)
TEMPERATURE = CENTIGRADE
CURRENT = AMPS

Define Transient time parameters

TM_START = start time (sec)
TMI* = time increment for solution (sec)
TME* = start and stop for time do-loops (sec)
Note: 1 year = 3.15576e7 seconds
TMTMAX = time of maximum cladding temperature

PARAMETER TM_START = 31.55760
PARAMETER TMI0 = 3155760.
PARAMETER TMI1 = .3155760E+08
PARAMETER TMI10 = .3155760E+09
PARAMETER TMI100 = .3155760E+10

PARAMETER TMI1000 = .3155760E+11
PARAMETER TME0 = .2840187E+08
PARAMETER TME1 = .3155763E+08
PARAMETER TME9 = .2840184E+09
PARAMETER TME10 = .3155760E+09
PARAMETER TME50 = .1577880E+10
PARAMETER TME90 = .2840184E+10
PARAMETER TME100 = .3155760E+10
PARAMETER TME1000 = .3155760E+11

Read in average effective conductivities from SNF model

PRINTOUT RESUMED BY /GOP

Define MPC/waste package parameters

(MPC dimensions converted from inches to meters)

Required Constants:

PARAMETER PI = 3.141593

Required container wall parameters:

MIRAD = inner radius of MPC shell (m)
MWALL = MPC shell thickness (m)
DCRAD = disposal container outer radius (m)
OWALL = outer barrier thickness (m)
IWALL = inner barrier thickness (m)

PARAMETER MIRAD = .7404100

PARAMETER MWALL = .2540000E-01

PARAMETER DCRAD = .9008000

PARAMETER OWALL = .1000000

PARAMETER IWALL = .2000000E-01

Required outer guide hardware parameters:

Set 1: TPGPL = top/bottom guide plate length (m)
TPGPT = top/bottom guide plate thickness (m)

PARAMETER TPGPL = .1606296

PARAMETER TPGPT = .6350000E-02

Set 2: SGCCW = Width; corner guide to far corner side guide (m)

SGCMW = Width; Side guide corner to Middle side guide (m)
SGCD1 = Vert. Dist. Down to Corner of Guide (m)

PARAMETER SGCCW = .5367528

PARAMETER SGCMW = .1722374

PARAMETER SGCD1 = .1772666

SET 3: GCORV = corner guide Vertical width (m)
GCORH = corner guide Horizontal width (m)
GX32 = X coord. of upper contact from drawing. (m)
GY32 = Y coord. of upper contact from drawing. (m)

PARAMETER GCORV = .1971040

PARAMETER GCORH = .1705864

PARAMETER GX32 = .4739989

PARAMETER GY32 = .5687987

SET 4: GLEN1 = side guide Low width (m)
GLEN2 = side guide High width (m)
GLENT = side guide total width (m)
GWALL = guide thickness (m)

PARAMETER GLEN1 = .1709166

PARAMETER GLEN2 = .3539998

PARAMETER GLENT = .7331964

PARAMETER GWALL = .9525000E-02

Required Tube/Fuel parameters:

HCELL = 1/2 of basket cell opening (m)
SWALL = stainless tube thickness (m)
AWALL = Al/boron tube thickness (m)
TWALL = stainless tube cladding thickness (m)
ACTVL = active fuel length
PEAKF = assembly heat axial peaking factor

PARAMETER HCELL = .7620000E-01

PARAMETER SWALL = .6350000E-02

PARAMETER AWALL = .6350000E-02

PARAMETER TWALL = .2387600E-02

PARAMETER ACTVL = 3.810000

PARAMETER PEAKF = 1.400000

Define calculated parameters

ASSY = assembly heat production (W) f(yrs)
FUEL = volumetric heat production (W/m3) f(yrs)
FVOLUME = assy_volume=cell_width^2*active_length
PITCH = basket cell outer width (m)
QCELL = 1/4 of basket cell opening (m)
SCCELL = 1/2 of basket cell opening+SS wall(m)
ACCELL = 1/2 of basket cell opening+SS+AL (m)
ATWCL = Dist. to edge of B-AL plate (m)
STWCL = Dist. to edge of Steel Bask. Plate (m)
TQPCL = Top quarter of cell dist. (m)

ARRAY PARAMETER ASSY DELETED.

SET PARAMETER DIMENSIONS ON ASSY TYPE=TABL DIMENSIONS= 101 1 1

SET PARAMETER DIMENSIONS ON FUEL TYPE=TABL DIMENSIONS= 101 1 1

PARAMETER FVLU = .8849015E-01

PARAMETER PITCH = .1825752

PARAMETER QCELL = .3810000E-01

PARAMETER SCELL = .8255000E-01

PARAMETER ACELL = .8890000E-01

PARAMETER ATWCL = .8737600E-02

PARAMETER STWCL = .1508760E-01

PARAMETER TQPCL = .5318760E-01

Determine the required contact points for the outer guide hardware
GX## = x coord. of guide/shell contact
GY## = y coord. of guide/shell contact

Set 1:

PARAMETER GX11 = .8031480E-01

PARAMETER GY11 = .7360411

Set 3:

PARAMETER GX31 = .6350603

PARAMETER GY31 = .3812197

Set 2:

PARAMETER GX24 = .9830753E-01

PARAMETER GY24 = .7338546

PARAMETER GX23 = .1078325

PARAMETER GY23 = .7325156

PARAMETER GX22 = .2705449

PARAMETER GY22 = .6892114

PARAMETER GX21 = .2800699

PARAMETER GY21 = .6853961

Set 4:

PARAMETER GY41 = .4762500E-02

PARAMETER GX41 = .7403947

PARAMETER GY44 = .3587623

PARAMETER GX44 = .6476856

PARAMETER GY43 = .1878457

PARAMETER GX43 = .7161850

PARAMETER GY42 = .1783207
PARAMETER GX42 = .7186158

Define 45 degree point of reference:

MI45 = x coord. MIRAD at 45 deg.
MO45 = x coord. MIRAD+MWALL at 45 deg.
DI45 = x coord. DCRAD-OWALL-IWALL at 45 deg.
DM45 = x coord. DCRAD-OWALL at 45 deg.
DO45 = x coord. DCRAD at 45 deg.
OFFS = 45 degree Y off set to go through centers

PARAMETER MI45 = .5235489
PARAMETER MO45 = .5415094
PARAMETER DI45 = .5521090
PARAMETER DM45 = .5662511
PARAMETER DO45 = .6369618
PARAMETER OFFS = .9128760E-01

Define different element types

TITLE=

40 BWR MPC/Waste Package with 10 yr old, 49 GWD/MTU SNF

SI UNITS SPECIFIED

LENGTH = METERS(M)
MASS = KILOGRAMS(KG)
TIME = SECONDS(SEC)
TEMPERATURE = CENTIGRADE
CURRENT = AMPS

Define Transient time parameters

TM_START = start time (sec)
TMI* = time increment for solution (sec)
TME* = start and stop for time do-loops (sec)
Note: 1 year = 3.15576e7 seconds
TMTMAX = time of maximum cladding temperature

PARAMETER TM_START = 31.55760

PARAMETER TM10 = 3155760.

PARAMETER TM11 = .3155760E+08

PARAMETER TM110 = .3155760E+09

PARAMETER TM1100 = .3155760E+10

PARAMETER TMI1000 = .3155760E+11
 PARAMETER TME0 = .2840187E+08
 PARAMETER TME1 = .3155763E+08
 PARAMETER TME9 = .2840184E+09
 PARAMETER TME10 = .3155760E+09
 PARAMETER TME50 = .1577880E+10
 PARAMETER TME90 = .2840184E+10
 PARAMETER TME100 = .3155760E+10
 PARAMETER TME1000 = .3155760E+11

 Read in average effective conductivities from SNF model

*** NOTE *** CP= .780 TIME= 17:24:47

PRINTOUT RESUMED BY /GOP
 Read in surface temps. from repository model

*** NOTE *** CP= .990 TIME= 17:24:48
 Restore ANSYS parameters from file= c21b5a.parm.

/INPUT FILE= c21b5a.parm LINE= 0

PRINTOUT RESUMED BY /GOP

 Define MPC/waste package parameters
 (MPC dimensions converted from inches to meters)
 Required Constants:

PARAMETER PI = 3.141593

Required container wall parameters:
 MIRAD = inner radius of MPC shell (m)
 MWALL = MPC shell thickness (m)
 DCRAD = disposal container outer radius (m)
 OWALL = outer barrier thickness (m)
 IWALL = inner barrier thickness (m)

PARAMETER MIRAD = .7404100
 PARAMETER MWALL = .2540000E-01
 PARAMETER DCRAD = .9008000
 PARAMETER OWALL = .1000000
 PARAMETER IWALL = .2000000E-01

Required outer guide hardware parameters:
 Set 1: TPGPL = top/bottom guide plate length (m)
 TPGPT = top/bottom guide plate thickness (m)
 PARAMETER TPGPL = .1606296
 PARAMETER TPGPT = .6350000E-02

Set 2: SGCCW = Width; corner guide to far corner side guide (m)

SGCMW = Width; Side guide corner to Middle side guide (m)
SGCD1 = Vert. Dist. Down to Corner of Guide (m)

PARAMETER SGCCW = .5367528

PARAMETER SGCMW = .1722374

PARAMETER SGCD1 = .1772666

SET 3: GCORV = corner guide Vertical width (m)
GCORH = corner guide Horizontal width (m)
GX32 = X coord. of upper contact from drawing. (m)
GY32 = Y coord. of upper contact from drawing. (m)

PARAMETER GCORV = .1971040

PARAMETER GCORH = .1705864

PARAMETER GX32 = .4739989

PARAMETER GY32 = .5687987

SET 4: GLEN1 = side guide Low width (m)
GLEN2 = side guide High width (m)
GLENT = side guide total width (m)
GWALL = guide thickness (m)

PARAMETER GLEN1 = .1709166

PARAMETER GLEN2 = .3539998

PARAMETER GLENT = .7331964

PARAMETER GWALL = .9525000E-02

Required Tube/Fuel parameters:

HCELL = 1/2 of basket cell opening (m)
SWALL = stainless tube thickness (m)
AWALL = Al/boron tube thickness (m)
TWALL = stainless tube cladding thickness (m)
ACTVL = active fuel length
PEAKF = assembly heat axial peaking factor

PARAMETER HCELL = .7620000E-01

PARAMETER SWALL = .6350000E-02

PARAMETER AWALL = .6350000E-02

PARAMETER TWALL = .2387600E-02

PARAMETER ACTVL = 3.810000

PARAMETER PEAKF = 1.400000

Define calculated parameters

ASSY = assembly heat production (W) f(yrs)
FUEL = volumetric heat production (W/m3) f(yrs)
FVOLUME = assy_volume=cell_width^2*active_length
PITCH = basket cell outer width (m)
QCELL = 1/4 of basket cell opening (m)
SCCELL = 1/2 of basket cell opening+SS wall(m)
ACCELL = 1/2 of basket cell opening+SS+AL (m)
ATWCL = Dist. to edge of B-AL plate (m)
STWCL = Dist. to edge of Steel Bask. Plate (m)
TQPCL = Top quarter of cell dist. (m)

ARRAY PARAMETER ASSY DELETED.

SET PARAMETER DIMENSIONS ON ASSY TYPE=TABL DIMENSIONS= 101 1 1

SET PARAMETER DIMENSIONS CN FUEL TYPE=TABL DIMENSIONS= 101 1 1

PARAMETER FVOLL = .8849015E-01

PARAMETER PITCH = .1825752

PARAMETER QCELL = .3810000E-01

PARAMETER SCELL = .8255000E-01

PARAMETER ACELL = .8890000E-01

PARAMETER ATWCL = .8737600E-02

PARAMETER STWCL = .1508760E-01

PARAMETER TQPCL = .5318760E-01

 Determine the required contact points for the outer guide hardware
 GX## = x coord. of guide/shell contact
 GY## = y coord. of guide/shell contact

Set 1:

PARAMETER GX11 = .8031480E-01

PARAMETER GY11 = .7360411

Set 3:

PARAMETER GX31 = .6350603

PARAMETER GY31 = .3812197

Set 2:

PARAMETER GX24 = .9830753E-01

PARAMETER GY24 = .7338546

PARAMETER GX23 = .1078325

PARAMETER GY23 = .7325156

PARAMETER GX22 = .2705449

PARAMETER GY22 = .6892114

PARAMETER GX21 = .2800699

PARAMETER GY21 = .6853961

Set 4:

PARAMETER GY41 = .4762500E-02

PARAMETER GX41 = .7403947

PARAMETER GY44 = .3587623

PARAMETER GX44 = .6476856

PARAMETER GY43 = .1878457

PARAMETER GX43 = .7161850

PARAMETER GY42 = .1783207

PARAMETER GX42 = .7186158

Define 45 degree point of reference:

MI45 = x coord. MIRAD at 45 deg.
 MO45 = x coord. MIRAD+MWALL at 45 deg.
 DI45 = x coord. DCRAD-OWALL-IWALL at 45 deg.
 DM45 = x coord. DCRAD-OWALL at 45 deg.
 DO45 = x coord. DCRAD at 45 deg.
 OFFS = 45 degree Y off set to go through centers

PARAMETER MI45 = .5235489

PARAMETER MO45 = .5415094

PARAMETER DI45 = .5521090

PARAMETER DM45 = .5662511

PARAMETER DO45 = .6369618

PARAMETER OFFS = .9128760E-01

Define different element types

DESIGN ANALYSIS

Volume II

Title: Thermal Evaluation of the Conceptual 40 BWR Multi-Purpose
Canister (MPC) with ACD Disposal Container (SCPB: N/A)

Document Identifier: BBABB0000-01717-0200-00003 REV 00

Originator: Thomas L. Lotz

Checker: Robert H. Bahney III

Lead Discipline Engineer: Thomas W. Doering

Department Manager: Hugh A. Benton

Date: November 8, 1995

TITLE=

40 BWR MPC/Waste Package with 10 yr old, 49 GWD/MTU SNF

SI UNITS SPECIFIED

LENGTH = METERS(M)
 MASS = KILOGRAMS(KG)
 TIME = SECONDS(SEC)
 TEMPERATURE = CENTIGRADE
 CURRENT = AMPS

Define Transient time parameters

TM_START = start time (sec)
 TMI* = time increment for solution (sec)
 TME* = start and stop for time do-loops (sec)
 Note: 1 year = 3.15576e7 seconds
 TMTMAX = time of maximum cladding temperature

PARAMETER TM_START = 31.55760
 PARAMETER TM10 = 3155760.
 PARAMETER TM11 = .3155760E+08
 PARAMETER TM110 = .3155760E+09
 PARAMETER TM1100 = .3155760E+10
 PARAMETER TM11000 = .3155760E+11
 PARAMETER TME0 = .2840187E+08
 PARAMETER TME1 = .3155763E+08
 PARAMETER TME9 = .2840184E+09
 PARAMETER TME10 = .3155760E+09
 PARAMETER TME50 = .1577880E+10
 PARAMETER TME90 = .2840184E+10
 PARAMETER TME100 = .3155760E+10
 PARAMETER TME1000 = .3155760E+11

Read in average effective conductivities from SNF model

*** NOTE *** CP= .780 TIME= 20:25:35
 Restore ANSYS parameters from file= pwr15e.parm.

/INPUT FILE= pwr15e.parm LINE= 0

PRINTOUT RESUMED BY /GOP
 Read in surface temps. from repository model

*** NOTE *** CP= 1.000 TIME= 20:25:35
 Restore ANSYS parameters from file= c21w5a.parm.

/INPUT FILE= c21w5a.parm LINE= 0

PRINTOUT RESUMED BY /GOP

Define MPC/waste package parameters
 (MPC dimensions converted from inches to meters)
 Required Constants:

PARAMETER PI = 3.141593

Required container wall parameters:
 MIRAD = inner radius of MPC shell (m)
 MWALL = MPC shell thickness (m)
 DCRAD = disposal container outer radius (m)

OWALL = outer barrier thickness (m)
IWALL = inner barrier thickness (m)

PARAMETER MIRAD = .7404100
PARAMETER MWALL = .2540000E-01
PARAMETER DCRAD = .8508000
PARAMETER OWALL = .5000000E-01
PARAMETER IWALL = .2000000E-01

Required outer guide hardware parameters:

Set 1: TPGPL = top/bottom guide plate length (m)
TPGPT = top/bottom guide plate thickness (m)

PARAMETER TPGPL = .1606296
PARAMETER TPGPT = .6350000E-02

Set 2: SGCCW = Width; corner guide to far corner side guide (m)
SGCMW = Width; Side guide corner to Middle side guide (m)
SGCD1 = Vert. Dist. Down to Corner of Guide (m)

PARAMETER SGCCW = .5367528
PARAMETER SGCMW = .1722374
PARAMETER SGCD1 = .1772666

SET 3: GCORV = corner guide Vertical width (m)
GCORH = corner guide Horizontal width (m)
GX32 = X coord. of upper contact from drawing. (m)
GY32 = Y coord. of upper contact from drawing. (m)

PARAMETER GCORV = .1971040
PARAMETER GCORH = .1705864
PARAMETER GX32 = .4739989
PARAMETER GY32 = .5687987

SET 4: GLEN1 = side guide Low width (m)
GLEN2 = side guide High width (m)
GLENT = side guide total width (m)
GWALL = guide thickness (m)

PARAMETER GLEN1 = .1709166
PARAMETER GLEN2 = .3539998
PARAMETER GLENT = .7331964
PARAMETER GWALL = .9525000E-02

Required Tube/Fuel parameters:

HCELL = 1/2 of basket cell opening (m)
SWALL = stainless tube thickness (m)
AWALL = Al/boron tube thickness (m)
TWALL = stainless tube cladding thickness (m)
ACTVL = active fuel length
PEAKF = assembly heat axial peaking factor

PARAMETER HCELL = .7620000E-01
PARAMETER SWALL = .6350000E-02
PARAMETER AWALL = .6350000E-02

PARAMETER TWALL = .2387600E-02
 PARAMETER ACTVL = 3.810000
 PARAMETER PEAKF = 1.400000

Define calculated parameters

ASSY = assembly heat production (W) f(yrs)
 FUEL = volumetric heat production (W/m3) f(yrs)
 FVOLL = assy_volume=cell_width^2*active_length
 PITCH = basket cell outer width (m)
 QCELL = 1/4 of basket cell opening (m)
 SCELL = 1/2 of basket cell opening+SS wall(m)
 ACELL = 1/2 of basket cell opening+SS+AL (m)
 ATWCL = Dist. to edge of B-AL plate (m)
 STWCL = Dist. to edge of Steel Bask. Plate (m)
 TQPCL = Top quarter of cell dist. (m)

ARRAY PARAMETER ASSY DELETED.

SET PARAMETER DIMENSIONS ON ASSY TYPE=TABL DIMENSIONS= 101 1 1

SET PARAMETER DIMENSIONS ON FUEL TYPE=TABL DIMENSIONS= 101 1 1

PARAMETER FVOLL = .8849015E-01
 PARAMETER PITCH = .1825752
 PARAMETER QCELL = .3810000E-01
 PARAMETER SCELL = .8255000E-01
 PARAMETER ACELL = .8890000E-01
 PARAMETER ATWCL = .8737600E-02
 PARAMETER STWCL = .1508760E-01
 PARAMETER TQPCL = .5318760E-01

Determine the required contact points for the outer guide hardware

GX## = x coord. of guide/shell contact
 GY## = y coord. of guide/shell contact

Set 1:

PARAMETER GX11 = .8031480E-01
 PARAMETER GY11 = .7360411

Set 3:

PARAMETER GX31 = .6350603
 PARAMETER GY31 = .3812197

Set 2:

PARAMETER GX24 = .9830753E-01
 PARAMETER GY24 = .7338546
 PARAMETER GX23 = .1078325
 PARAMETER GY23 = .7325156

PARAMETER GX22 = .2705449
 PARAMETER GY22 = .6892114
 PARAMETER GX21 = .2800699
 PARAMETER GY21 = .6853961

Set 4:

PARAMETER GY41 = .4762500E-02
 PARAMETER GX41 = .7403947
 PARAMETER GY44 = .3587623
 PARAMETER GX44 = .6476856
 PARAMETER GY43 = .1878457
 PARAMETER GX43 = .7161850
 PARAMETER GY42 = .1783207
 PARAMETER GX42 = .7186158

Define 45 degree point of reference:

MI45 = x coord. MIRAD at 45 deg.
 MO45 = x coord. MIRAD+MWALL at 45 deg.
 DI45 = x coord. DCRAD-OWALL-IWALL at 45 deg.
 DM45 = x coord. DCRAD-OWALL at 45 deg.
 DO45 = x coord. DCRAD at 45 deg.
 OFFS = 45 degree Y off set to go through centers

PARAMETER MI45 = .5235489
 PARAMETER MO45 = .5415094
 PARAMETER DI45 = .5521090
 PARAMETER DM45 = .5662511
 PARAMETER DO45 = .6016064
 PARAMETER OFFS = .9128760E-01

Define different element types
