12. REMARKS

This is an approved SCOPING Analysis. The QAP 2-0 Activity Evaluation, "Perform Criticality, Thermal, Structural, and Shielding Scoping Analysis", DI#: BB0000000-01717-2200-00026 REV 01, lists the procedural controls which are required. Therefore, this analysis is NOT subject to the QAP 3-0-series procedures and does not require QAP 3-9 signatures. All information contained in this analysis is TBV and has received a technical review only.

1. Purpose

This analysis is prepared by the Mined Geologic Disposal System (MGDS) Waste Package Development Department (WPDD) to determine the dose rates from the MPC waste packages to be used by the EBS and other repository systems to incorporate ALARA practices in the overall repository design in compliance with the goals of the Waste Package Implementation Plan^{5.1} for conceptual design. These design calculations are performed in sufficient detail to provide a comprehensive comparison base with other design alternatives. The objectives of this evaluation are 1) to show the dose rate as a function of distance from the waste package surface and 2) to provide the shielding thicknesses required for the waste package transporter to meet a 10 mrem/hr target dose rate at 2 meters from the transporter surface.

2. Quality Assurance

The QA Program applies to this analysis. The work reported in this document is part of the neutronic analysis for conceptual design. This activity can impact the proper functioning of the MGDS waste package; the waste package has been identified as an MGDS Q-List item important to radiological safety^{5.2}. The work performed for this analysis is covered by a QAP-2-0 analysis, titled "Perform Criticality, Thermal, Structural and Shielding Scoping Analyses", generated by the Waste Package Development Group^{5.3}. The QAP-2-0 evaluation determined such activities to be subject to *Quality Assurance Requirements and Description (QARD)*^{5.4} requirements.

3. Method

The method of this analysis uses the industry standard transport code DORT^{5.6} to calculate neutron and gamma fluxes throughout the region of interest. Computer code ORIGEN2^{5.5} is used to generate the fuel isotopics and source, and GIP^{5.6} is used to generate the material macroscopic cross sections of the problem.

4. Design Inputs

4.1 Design Parameters

4.1.1 PWR Mechanical Parameters

The fuel assembly upon which this calculation is based is the B&W 15 x 15 fuel assembly. The mechanical parameters for this assembly type are shown in the table below.

TABLE 4.1-1 Mechanical Parameters of B&W 15x15 Fuel Assembly

4.2 Criteria

This design analysis provides the repository shielding control design criteria for MPC Waste Packages, based upon criteria from the EBD-RD^{5.11}. As indicated in the requirements, no direct shielding function is required of the waste package, but interfacing is required between the EBS and repository segments. The criteria cited in requirement documents that have bearing on this analysis include:

"3.1.5 MAJOR CONSIDERATIONS AND ASSUMPTIONS

- E. Shielding allocations between the Repository Segment and the Engineered Barrier Segment have not been determined. Currently, the waste package will not be required to be self-shielded. The assumption is that if the waste package is not self-shielded, the repository will provide the required shielding for radiological protection for all modes of facility operation. Shielding allocations will be determined by future trade studies."

"3.2.2.1 RADIOLOGICAL PROTECTION - GENERAL REQUIREMENTS

- A. The Engineered Barrier Segment, together with the Repository Segment, shall, to the extent practicable, be designed and constructed with engineering controls based upon sound radiation protection principles to achieve occupational doses and doses to members of the public that are as low as is reasonably achievable (ALARA). ALARA principles shall be based on the applicable sections of the NRC Regulatory Guides 8.8 and 8.10. [MGDS-RD 3.2.2.1.B][10CFR20.1101(b)]
- C. The Engineered Barrier Segment, together with the Repository Segment, shall provide adequate shielding from radioactive components and high ambient temperatures. [Derived]"

"3.2.3.3 ENGINEERED BARRIER SEGMENT - REPOSITORY SEGMENT INTERFACE REQUIREMENTS

- B.3 The Engineered Barrier Segment, together with the repository design and operations, shall include provisions for controlling doses such that when approved operational procedures are followed, the exposure doses specified in 10 CFR 20.1201 for occupational doses, and 10 CFR 20.1301 for individual members of the public, are not exceeded. [Derived] [10 CFR 20.1201, .1301]"

The criteria provided in section 3.1.5 is repeated in section 3.2.3.3(A.4)

4.3 Assumptions

All assumptions identified in this section will require verification (or superseding assumptions) as the waste package design proceeds and should be treated as TBV items for preliminary design. For Pre-title II design (conceptual or preliminary), assumptions are identified and documented, but they are not subject to MGDS NLP-3-15.

- 4.3.1 The design of the 21 PWR assembly MPC waste package is based on reference 5.12. This assumption is used in Sections 7.3.1 and 7.4.1.
- 4.3.2 The design of the 40 BWR assembly MPC waste package is based on reference 5.13. This assumption is used in Sections 7.3.2 and 7.4.2.
- 4.3.3 The reference BWR fuel assembly selected for conceptual MPC development is the GE 8x8 fuel type. This assumption is used in Sections 7.4.2 and 7.5.2.
- 4.3.4 The reference PWR fuel assembly selected for conceptual MPC development is the B&W 15 x 15 fuel type. This assumption is used in Sections 7.4.1 and 7.5.1.
- 4.3.5 The design basis BWR SNF characteristics used are: 3.74% initial U-235 enrichment, 49.0 GWd/MTU burnup, and a 10 year decay as established by the M&O^{5.14}. This assumption is used in Sections 7.4.2 and 7.5.2.
- 4.3.6 The design basis PWR SNF characteristics used are: 4.2% initial U-235 enrichment, 48.086 GWd/MTU burnup, and a 10 year decay time as established by the M&O^{5.14}. This assumption is used in Sections 7.4.1 and 7.5.1.
- 4.3.7 The subcritical multiplication factor used for the 21 PWR assembly MPC waste package is 0.28^{5.15}. This assumption is used in Sections 7.4.1 and 7.5.1.
- 4.3.8 The subcritical multiplication factor used for the 40BWR assembly MPC waste package is 0.40 and is a conservatively high estimate made in the absence of a calculation at the time the analysis was performed. This assumption is used in Sections 7.4.1 and 7.5.1.
- 4.3.9 The fuel region contents are homogenized over the entire fuel region volume of the MPC, thus reducing the physical density of the contents, but maintaining the source strength. This method of solution was shown in reference 5.16 to be conservative in results, and therefore, the results are not compromised. This assumption is used in Sections 7.4.1 and 7.5.1.
- 4.3.10 The non-fuel material compositions are taken from a separate materials composition analysis^{5.17}. This analysis was performed to provide a single QA'ed reference for material compositions. This assumption is used throughout Section 7.

4.4 Codes and Standards

Not Applicable.

6. Use of Computer Software

6.1 Scientific and Engineering Software

The analysis codes run were performed on the HP-9000 series 835 and series 735. All codes used had been certified in accordance with BWNT procedures, but have not been validated in accordance with M&O QA procedures.

The analysis codes run are listed below.

ORIGEN2 version 1.1HP. Calculates the activity and fuel isotopics for a given burn.

GIP version 1.7HP. Calculates the macroscopic cross sections of the materials provided.

DORT version 1.0HP. Neutron and gamma transport code that ultimately calculates the dose rates for a given configuration.

6.2 Computational Support Software

Microsoft EXCEL 4.0 was used to trend and organize the DORT results in tabular and graphical plots.

7. Design Analysis

7.1 Discussion

ORIGEN2 will be run to generate the source for the fuel region, upper and lower end fitting sources. ORIGEN2 will generate an 18 group photon spectrum and a 1 group neutron spectrum. Two additional codes will be run to convert that source into the BUGLE 47 neutron group and 20 gamma group spectrum. This source will be used in DORT for the appropriate regions as the radiation source. A DORT model will represent the MPC canister and shield for the purposes of optimizing the design. The shield thicknesses will be iterated upon until the acceptance criteria previously mentioned is met. GIP will produce the cross sections for the materials in the problem and will generate a library of the information that DORT will access.

Four separate models will be run: One each for the radial and axial directions for the PWR fuel filled MPC and the BWR fuel filled MPC. Each model will be optimized separately and the results reported. Additionally, an analysis with no shield will be performed. This simply is accomplished using the existing models and changing the shielding materials to air.

TABLE 7.1-1 Fuel Source Parameters

	PWR	BWR
Burnup (MWD/MTU)	48086	49000
Enrichment (wt% U235)	4.2	3.74
Decay (years)	10	10

In addition to generating the source terms for the problem, ORIGEN2 will generate the fuel isotopic content at the end of the burn. These values, as well as those constituents that make up the MPC will be used as input to GIP to generate the macroscopic cross sections for each problem region. GIP generates a library tape that DORT will access to solve the transport equations.

A single R- θ case was run for the PWR geometry. The case was unshielded and the azimuthal dose rates were plotted around the circumference (1/8 core symmetry). The azimuthal variation of the dose rate around the waste package is negligible. It was shown that the waste package dose rate varied only slightly (~2%) azimuthally, and therefore negated the need for additional analyses in the R- θ direction.

In the following sections, the source, material, and geometry calculations will be summarized.

7.2 Source

The source strength and burned fuel isotopics were calculated using ORIGEN (Reference [5.5]) to burn the fuel for the prescribed amount of time and decay the results. The fuel source was directly derived from the ORIGEN output using two conversion codes to generate the BUGLE energy group source terms for input into DORT.

7.2.1 PWR Fuel

The typical B&W Mark IV 15x15 fuel assembly is loaded with 463.6 kg U. Therefore;

$$M_{U235} = (0.042)(0.463e6 \text{ g}) = 1.9471e4 \text{ g U235/assy}$$

$$M_{U238} = (1-0.042)(0.463e6 \text{ g}) = 4.4413e5 \text{ g U238/assy}$$

TABLE 7.2.1-1 B&W Mark IV Constituent Masses

Constituent	Mass (g/assy)
O	6.5298e4
Zr	1.0619e5
Cr	1.0816e2
Fe	2.1632e2
Sn	1.5143e3
U238	4.4413e5
U235	1.9471e4

These values will go into ORIGEN for two purposes: to burn the fuel and calculate the post

irradiation atomic composition, and to generate the source terms for the DORT analysis. Nothing but the fuel assemblies are included in the above values. That is, no MPC spacers, or MPC structural supports materials are included in the masses shown above. Additionally, no end fitting materials are included in this summary as those sources will be calculated separately.

Burnup = 48086 MWD/MTU

Mass = 463.6 kg U/assy

$$(48086 \text{ MWD/MTU})(0.4636 \text{ MTU/assy}) = 22292.6696 \text{ MWD/assy}$$

$$(2772 \text{ MW/177 assy}) = 15.661 \text{ MW/assy}$$

$$(22292.6696 \text{ MWD/assy}) / (15.661 \text{ MW/assy}) = 1423.45 \text{ days burn time}$$

A constant average power over the irradiation history is assumed. It will be arbitrarily broken up into 4 periods for the ORIGEN run.

TABLE 7.2.1-2 ORIGEN burn periods

Cumulative days	Delta days	Cummulative Burnup (MWD)
0	0	0
400	400	13512.52
800	400	27025.04
1200	400	40537.57
1423.45	273.45	48086

The output from the ORIGEN2 run was manipulated by NEUTSOR and CONVERT (Ref [5.21]) to convert the ORIGEN output source strength to that of the BUGLE 67 group (47 neutron, 20 gamma) structure. To do this, a conversion factor must be applied to the ORIGEN output to convert the source to the correct units. The ORIGEN output must be normalized to the volume of the fuel region of the waste package.

$$Nf_{\gamma} = (21 \text{ assy} / 4.87005\text{e}6 \text{ cc}) = 4.312070\text{e-}6 \text{ assy/cc}$$

The neutron normalization factor must further account for subcritical multiplication. Keff is assumed to be 0.28.

$$Nf_n = (4.312070\text{e-}6)(1/(1-0.28)) = 5.98898\text{e-}6 \text{ assy/cc}$$

The neutron and photon source strength from the ORIGEN output at 10 years decay will be run through NEUTSOR and CONVERT to generate the appropriate sources.

7.2.1.1 PWR End Fittings Source

As with the fuel source, the end fittings source will be generated using ORIGEN2. The end fitting constituents will be calculated below.

To calculate the activation of the upper end fitting (UEF), and lower end fitting (LEF), only U235 and U238 were input together with the composition of the desired UEF or LEF for a single fuel assembly.

For the PWR, the composition of the UEF region was stainless steel 304, inconnel 718, and air. The composition of the LEF was stainless steel 304, zircalloy 4 and air. The air was not modeled as its activation is negligible. The masses of the end fitting constituents were input into each respective ORIGEN2 deck along with the appropriate U235 and U238 masses. The source strength at ten years decay was used for the shielding study.

TABLE 7.2.1.1-1 END FITTING COMPOSITION

Material	Volume fraction	Element	UEF Mass (gm)	LEF Mass (gm)
SS304	UEF = 0.235, LEF = 0.2908	C	12.228	3.33

U235	1.9471E+4		
U238	4.4413E+5		

These values from TABLE 7.2.1.1-2 were input into ORIGEN2 (one case each for LEF, and UEF) and burned for the same amount of time previously calculated in the fuel region source section. The output was fed into CONVERT for conversion into the BUGLE energy group spectrum. To do so, a normalization factor was calculated for the source. Since the ORIGEN run only modeled 1 assembly end fitting, the normalization factor would account for the difference in masses and distribute out the source into the end fitting volume. See the geometry section for the dimensions of the source regions.

$$NF = \frac{\text{Number of assemblies}}{\text{Volume of end fitting region}}$$

For UEF:

$$NF = \frac{21 \text{ assy}}{\pi (65.6 \text{ cm})^2 (442.44575 \text{ cm} - 425.13875 \text{ cm})}$$

$$NF = 8.975113(10)^{-5} \frac{\text{assy}}{\text{cc}}$$

For LEF:

$$NF = \frac{21 \text{ assy}}{\pi (65.6 \text{ cm})^2 (30.645 \text{ cm} - 26.836 \text{ cm})}$$

$$NF = 4.078033(10)^{-4} \frac{\text{assy}}{\text{cc}}$$

7.2.2 BWR Fuel

The source for the BWR fuel was calculated as that of the PWR described above. That is, the fuel assembly constituents were burned for the appropriate amount of time using the code ORIGEN2. This produced the end product source that had to be converted into the BUGLE library structure. To proceed with this method, the fuel loading is to be calculated [5.23].

$$UO_2$$

$$\text{Fuel Loading} = 182.6 \frac{\text{kg } U}{\text{assy}}, 3.74 \text{ wt\% } U235$$

$$\rho = 10.96 \frac{\text{g}}{\text{cc}}, 95\% \text{ Theoretical density}, \therefore \rho_{th} = 10.412 \frac{\text{g}}{\text{cc}}$$

$$M_{235} = 6829.24 \frac{\text{g}}{\text{assy}}$$

$$M_{238} = 175770.76 \frac{\text{g}}{\text{assy}}$$

$$M_O = 25278.28 \frac{\text{g}}{\text{assy}}$$

The time of burn is calculated from the burnup prescribed in the problem description.

$$\text{Burnup} = 49000 \frac{\text{MWD}}{\text{MTU}}$$

$$\text{Thermal Power} = 4205.0 \frac{\text{kw}}{\text{assy}}$$

$$\text{Fuel Loading} = 182.6 \frac{\text{kg}}{\text{assy}}$$

$$\frac{P}{M} = \frac{4205.0 \text{ kw}}{0.1826 \text{ MTU}} = 23.02 \frac{\text{MW}}{\text{assy}}$$

$$\text{Cycle} = \frac{49000 \frac{\text{MWD}}{\text{MTU}}}{23.02 \frac{\text{MW}}{\text{MTU}}} = 2127.8 \text{ days}$$

A flat irradiation history is assumed. For the purposes of ORIGEN2, three irradiation periods are arbitrarily assumed.

Period (days)	Interval (days)	Period (burnup, GWD/MTU)
0 - 750	750	0 - 17.271
750 - 1500	750	17.271 - 34.543
1500 - 2127.8	627.8	34.543 - 49.0

The output from ORIGEN2 must be converted into a volumetric source in the Bugle structure. CONVERT and NEUTSOR perform this function, but require a normalization factor. A subcritical multiplication factor of 0.4 is assumed.

$$NF_v = (40 \text{ assy}) \left(\frac{1}{5071222 \cdot .171 \text{ cc}} \right) = 7.887645 \text{ e-6}$$

$$NF_n = 7.887645 \text{ e-6} \left(\frac{1}{1 - 0.4} \right) = 1.31461 \text{ e-5}$$

7.2.2.1 BWR End Fittings Source

The end fittings source was calculated as was the PWR end fittings described previously. The end fittings were only constructed of stainless steel 304. The masses of various constituents are summarized below.

TABLE 7.2.2.1-1 BWR ENDI FITTINGS MASS SUMMARY

SS 304	UEF (grams)	LEF (grams)
C	1.678	3.736
Co	4.196	9.340
Cr	398.620	887.3
Fe	11410.8	3140.342
Mn	41.96	93.400
N	8.392	18.680
Ni	209.800	467.000
P	0.944	2.102
S	0.629	1.401
Si	20.980	46.700

The normalization factors, as described previously, are calculated as follows for the LEF, and UEF.

Height of UEF region = 5.588 cm. Height of LEF region = 3.1623 cm. Radius of region = 65.0907 cm.

$$NF_{\gamma\text{UEF}} = 40/(\pi(65.0907 \text{ cm})^2 (5.588 \text{ cm})) = 5.377938\text{E-4 UEFs/cc}$$

$$NF_{\gamma\text{LEF}} = 40/(\pi(65.0907 \text{ cm})^2 (3.1623 \text{ cm})) = 9.503184\text{E-4 LEFs/cc}$$

7.3 Geometry

7.3.1 PWR Geometry

The PWR model is set up in two models: Radial, and Axial. Both models start from the center of the fuels section and extend beyond the two meter dose point from the surface of the shield.

Figure 7.3.1-1 depicts the final dimensions used for the PWR MPC optimization. (See the results section for dose rates associated with this configuration).

The figure shown was actually run in two parts. The axial model depicted the fuel from the zero reference point down through the waste package, and beyond the two meter dose point in air. Radially, the axial model runs from the center of the waste package fuel region out to the outside edge of the outer barrier. The axial dimensions are shown in TABLE 7.3.1-1.

The radial model depicts the waste package from the center of the waste package fuel region out radially through the MPC and shield out beyond the shield surface. Axially, the radial model extends from the bottom of the lower end fittings (LEF) to the top of the upper end fittings (UEF).

7.3.2 BWR Geometry

The BWR MPC model was again split into two pieces: A radial model extending from the center of the fuel region outward to the dose point 2 meters from the shield surface, and an axial model extending from the center of the fuel region down through the MPC out to the dose point. As before, the lower half of the cask was chosen to be modeled as it was deemed more conservative to include the lower end fitting (due to its higher mass, it presents a greater source than that of the upper end fitting).

TABLE 7.3.2-1 BWR AXIAL DIMENSIONS

7.4 Materials

7.4.1 PWR Materials and Cross Sections

The material cross sections will be generated by GIP (Ref. [5.6]). Using material number densities previously calculated in Ref[5.18], and those calculated herein, GIP will be run to generate the cross sections for this problem.

All the fuel assembly input into GIP will have a 'per assembly' basis. The 'fuel region' value will mix the appropriate fuel region constituents by volume.

Though the fuel region has 21 PWR assemblies and stainless sheets between them, it is non-conservative to homogenize these sheets uniformly into the fuel region. Therefore, only fuel assy constituents will be homogenized into the entire fuel region and ss/boral sheets will be modeled only on the fuel region periphery.

TABLE 7.4-1 FUEL MASS DATA

Element	M (g/assy, from ORIGEN) ¹	M (atoms/b cm assy)
U235	3.191e3	4.7717e-5
U236	2.553e3	3.8027e-5
U238	4.300e5	6.3510e-3
Pu239	2.188e3	3.2181e-5
Pu240	7.891e2	1.1558e-5
Pu241	4.987e2	7.2740e-6

Example calculation:

$$ND_x = \frac{m_x \left(\frac{g}{assy} \right) \frac{A_v \left(\frac{atoms}{g} \right)}{M_x}}{V_{assy} \left(\frac{cc}{assy} \right) 10^{24} \left(\frac{bcm}{cc} \right)}$$

$$\therefore ND_x = \frac{m_x}{M_x} \left(\frac{6.023 \text{ e}23}{171340 .6092 \text{ e}24} \right) = 3.5152 \text{ e}-6 \frac{m_x}{M_x}$$

Fuel region volume fractions Ref[5.18], p.4

$$\text{Fuel} = \text{Vol UO}_2 / \text{Vol assy} = 0.30101 \text{ cc UO}_2 / \text{cc assy}$$

¹This ORIGEN data represents 48086 MWD/MTU burnup. The 21 kg loss of metal mass has been converted to fission products. It is conservative to neglect the fission products.

$$\text{Clad} = \text{Vol Zirc-4} / \text{Vol assy} = 0.094759 \text{ cc Zirc/cc assy}$$

$$\text{Air} = \text{Vol Air/Vol assy} = 0.60423 \text{ cc Air/cc assy}$$

NUMBER DENSITIES FOR ZIRC-4 Ref[5.18] p.6

Element	wt%	M (g/mole)	ND (atoms/b cm assy)
O	0.12	15.994	2.8085e-5
Cr	0.1	51.996	7.1994e-6
Fe	0.2	55.847	1.3406e-5
Zr	98.18	91.22	4.0290e-3
Sn	1.4	118.69	4.4155e-5

The fuel masses were calculated by ORIGEN, and the number densities will be derived from those values. The oxygen number density of UO2 will be calculated below.

$$\frac{1}{M_U} = \frac{1}{100} \left(\frac{4.2}{235.0439} + \frac{95.8}{238.0508} \right)$$

$$M_U = 237.92 \text{ g/mole}$$

$$M_{UO_2} = 237.92 + 2(15.999) = 269.92$$

$$\text{wt\% oxygen} = \frac{2(15.999)}{269.92}$$

$$\rho_{\text{oxygen}} = \left(0.11855 \frac{\text{gO}}{\text{gUO}_2} \right) \left(10.96 \frac{\text{g}}{\text{cc}} \right) (0.95 \text{ th. density}) = 1.2343 \frac{\text{g}}{\text{cc}}$$

$$ND_O = \frac{\left(1.2343 \frac{\text{g}}{\text{cc}} \right) \left(6.023 \times 10^{23} \frac{\text{atoms}}{\text{mole}} \right) \left(0.30101 \frac{\text{cc air}}{\text{cc assy}} \right)}{\left(15.999 \frac{\text{g}}{\text{mole}} \right) \left(10^{24} \frac{\text{bcm}}{\text{cc}} \right)} = 1.4093 \times 10^{-2} \frac{\text{atoms}}{\text{bcm assy}}$$

NUMBER DENSITIES FOR AIR

Element	wt %	Mx (g/mole)	ND (atoms/b cm assy)
N	80	14.0031	2.4964e-5
O	20	15.999	5.4609e-6

All the fuel region constituents will be summarized below. This includes the fuel, clad and air of the typical assembly. These values must still be reduced by the volume fraction of the assemblies to that of the volume of the entire fuel region of the cask. See the following pages.

SUMMARY TABLE OF FUEL REGION CONSTITUENTS

Element	ND (atoms/b cm assy)
O	1.4127e-2
Cr	7.1994e-6
Fe	1.3406e-5
Zr	4.0290e-3
Sn	4.4155e-5
U235	4.7717e-5
U236	3.8027e-5
U238	6.3510e-3
Pu239	3.2181e-5
Pu240	1.1558e-5
Pu241	7.2740e-6

Number densities for all the other constituents outside the fuel region will be shown below.

NUMBER DENSITIES FOR ALLOY A516, Ref [5.20]

Element	Mx	wt%	ND (atoms/b cm A516)
C	12.0112	0.22	8.6402e-4
Si	28.0860	0.275	4.6188e-4

P	30.9738	0.035	5.3304e-5
S	31.9721	0.035	5.164e-5
Mn	54.9381	0.90	7.7278e-4
Fe	55.8470	98.535	8.3229e-2

The fuel assembly number densities account for the constituents on an assembly basis. Since no ss/boral is being homogenized into the fuel region, the assembly data will only be mixed with air in the free volume of the MPC fuel region. Volume fractions are calculated below. Since all the lengths are the same, and the term factors out of each equation, only areas are calculated.

$$V_{\text{assy}} = (21_{\text{assy}})(21.811 \text{ cm})^2 = 9990.1411 \text{ cm}^2$$

$$V_{\text{fuel region}} = \pi(65.6045 \text{ cm})^2 = 13521.259 \text{ cm}^2$$

$$VF_{\text{assy}} = (9990.1141)/(13521.259) = 0.7388426$$

$$VF_{\text{air}} = 0.2611574$$

These values will be applied to the fuel assembly number densities in the GIP mixing table to calculate the fuel region homogenized values.

Finally, the uranium tailings number densities will be calculated for uranium shielding of the MPC. The uranium shield is U-238 with a residual U-235 weight percent of 0.2. Thus, the weight fraction of U-235 is:

$$wf(U235) = 0.002$$

$$wf(U238) = 0.998$$

The atom fraction is correspondingly noted as af (U-235), etc.

The atom fraction is related to the weight fraction as follows:

$$wf(U-235) = \frac{N^{U-235} A^{U-235}}{N^{U-235} A^{U-235} + N^{U-238} A^{U-238}}$$

$$af(U-235) = \frac{N^{U-235}}{N^{U-235} + N^{U-238}}$$

$$\frac{N^{U-238} A^{U-238}}{N^{U-235} A^{U-235}} = \frac{1}{wf(U-235)} - 1$$

$$\frac{N^{U-238}}{N^{U-235}} = \frac{1}{af(U-235)} - 1$$

$$af(U-235) = \frac{1}{1 + \frac{A^{U-235}}{A^{U-238}} \left(\frac{1}{wf^{U-235}} - 1 \right)}$$

This yields:

$$A(U-235) = 235.043915, A(U-238) = 238.05077$$

$$af(U-235) = 0.0020255$$

Title: 125 Ton MPC Waste Package Shielding Analysis / 2-D DORT**Document Identifier:** BBABB0000-01717-0200-00005 REV 00**Page 59 of 81**

$$af(U-238) = 0.997974$$

$$\rho = 19.05 \text{ g/cc}$$

$$\begin{aligned} ND(\text{natural U}) &= (19.05)(.6023)/(0.0072(235.043915 \text{ U235}) + (0.9928(238.05077)) \\ &= 0.04819957 \text{ atoms U/b cm} \end{aligned}$$

$$ND(U-235) = ND(\text{natural U})(0.00202...) = 9.76298e-5 \text{ atoms U235/b.cm U235}$$

$$ND(U-238) = ND(\text{natural U})(0.99794...) = 4.81019e-2 \text{ atoms U238/b.cm U238}$$

The following table represents the GIP input mixing table of all the individual constituents of the MPC problem.

7.4.2 BWR Materials and Cross Sections

The same materials were used with the BWR analysis as with the PWR analysis with the obvious exception of the fuel region, upper and lower end fittings. One additional material was also added unique to the BWR analysis: Zirc-2.

$$VF_{\text{zirc}} = 0.05626$$

$$VF_{\text{air}} = 0.78248$$

7.5 Analysis

Tables 7.5.1-1 and -2 summarize the optimization runs. Since the dimensions set in the DORT analysis had forseen the necessary shield manipulation, the intervals were made in half centimeter increments. The shield dimensions were simply accomplished by altering the DORT 8\$ array to add or subtract lead/poly intervals as necessary. The radial dose rates were taken at the fuel region axial centerline, 2 meters from the surface of the shield. The axial dose rate was taken at the radial centerline, 2 meters from the surface of the shield. The dose rates reported were interpolated from the DORT run results.

Unshielded cases were also run and are shown in Section 8.0 in graphical form.

7.5.1 PWR Analysis

TABLE 7.5.1-1 PWR MPC RADIAL OPTIMIZATION SUMMARY

Filename	Lead (cm)	Poly (cm)	Lead (cm)	Gamma Dose Rate	Neutron Dose Rate	Total Dose Rate (mrem/hr)
mcpwrb.in2	7	10	1	1.826	3.1305	4.9564

mpcbwrc.in3	8	7.5	1	4.7826	4.2815	9.0641

⁵This input file did not differ from the preceeding input except that the air gap was increased to 30 cm.

8.0 Conclusions/Summary of Results

The final shielding configurations for all four cases of the MPC analysis are presented below. These configurations meet the previously stated criteria of dose rate less than 10 mrem/hour at the 2 meter dose point and a rough 50/50 proportion of gamma/neutron contribution.

Unshielded cases were run for the base case, as this is the configuration of the stored waste package. Those results are shown graphically in this section.

TABLE 8.0-1 MPC SHIELDING SUMMARY AT 2 METER DOSE POINT

9.0 Attachments

The attached files are those computer runs (input and output files) whose results met the acceptance criteria. Due to size constraints, the entire output files are not attached (each output file is approximately 200000 lines, 15-20 Mbytes). Instead, the output files have been edited and only the input and the usable output has been included. The usable output is defined herein as that output that has been used in this referenced. Other than deleting superfluous data, the output is unaltered.
