CC Cradle-Jack Failure Analysis

Introduction

The Central Calorimeter and its support cradle (Figure 1) are to be supported by either hydraulic or mechanical jacks. If hydraulics are used, each support will use two hydraulically coupled jacks with two out of the four supports hydraulically coupled giving the effect of a three point support system. If mechanical jacks are used, all four points are used for support. Figure 2 shows two examples of jack placement on a 3.5 inch support plate.

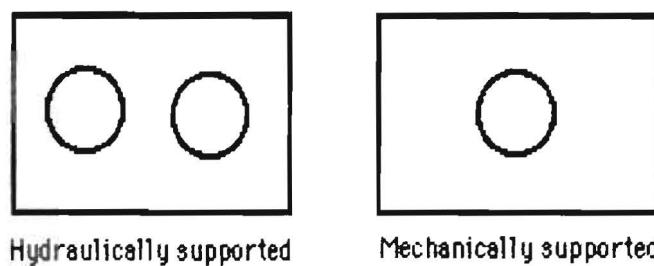

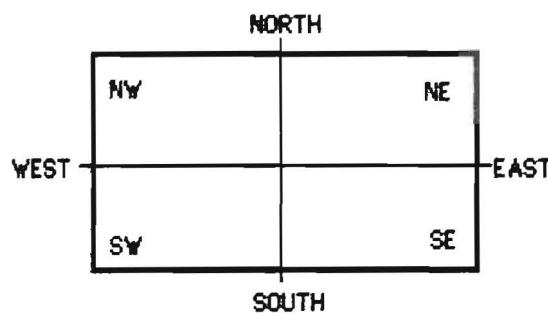

Figure 2

These two support scenarios lead to five jack failure cases to be studied. This report deals with the way in which a 0.25 inch drop (Failed jack) at one support affects the stresses in the cradle. The stresses from each failure case were analysed in two ways. First, stress factors, defined as quotients of stress intensities of the failed case with respect to the static case, were generated and then, hand calculations similar to those in Engineering Note 3740.215-EN-14 (Reference 1) were done using the reaction forces from the failed case.

The Five Failure Cases

Viewing the Central Calorimeter Support Cradle from the top.

Where **SE** equals **QUADRANT 1**, **NE** equals **QUADRANT 2**, **SW** equals **QUADRANT 3**, and **NW** equals **QUADRANT 4**. These are the four point of support. The five failure cases are as follows:

NUMBERONE: SW-SE Hydraulic Tie; NE Failure

NUMBERTWO: SW-SE Hydraulic Tie; SW-SE Failure

NUMBERTHREE: NW-SW Hydraulic Tie; NE Failure

NUMBERFOUR: NW-SW Hydraulic Tie; NW-SW Failure

NUMBERFIVE: ALL MECHANICAL; NE Failure

The failure cases and the quadrants noted above will be referred to by the above names for the remainder of this report.

Finite Element Model

Figure 3 shows a finite element model of the Central Calorimeter Support Cradle. For the hydraulic cases, the cradle is supported by tied beams (STIF4) and spars (STIF8) that ensure that hydraulically coupled supports will produce identical reaction forces, as do real hydraulics. The failed quadrant consists of a 'gap' element (STIF52) at each support node with a 0.25 inch initial gap. This element will allow a jack failure simulation at that quadrant. For the mechanical case, the cradle is supported by 0.00 inch initial gap spacers with 0.25 initial gap spacers at the failed quadrant. Loads and individual support arrangement are equivalent to that in Reference 1 and can be found in that note.

Factor Listing

Two FORTRAN programs (Appendix 1 and 2) were used to manipulate stress output from the finite element runs. The first, the Delete program, deletes all unnecessary headers from the stress printouts. The second, called Program, takes the stress intensity of the static case and a failed case, divides them, and prints these factors and also the coordinates of each node. This list (approximately 1740 nodes) is reduced to the nodes that lie in the points of interest noted in Reference 1 (Section A-A, Section B-B, Tie Plate, Stanchion and 3.5 inch Support Plates, and the Arm Connect). Figures 4-8 show the nodes chosen for this analysis. The program was also modified to pick out the factors that are greater than 1.2 and less than 0.75. Appendices 3 through 7 contain the factor listings for cases NUMBERONE through NUMBERFIVE.

Hand Calculations

Stress calculations for the static case were done by Leo Engstrom in Reference 1. Stresses for each of the failure cases are tabulated in Table 2 of this report (Appendix 8 has the actual calculations). All of the calculations follow the exact format of Reference 1. The reactions used for these calculations are tabulated in Table 1 of this report and are ANSYS® generated.

Conclusion

The hydraulic cases show that the reactions on the 3.5 inch support plate are well distributed throughout the four plates. (Largest factor from table 1 is 1.047) Because of this, the hand calculations for the hydraulic cases are approximately equivalent to that of the static calculations in reference 1. The largest deviation from the static case is 0.755 ksi in the bending stress of the 3.5 inch bearing plate of case NUMBERONE. The largest factor for the hydraulic cases is 1.3302 and is found in the arm of the failed quadrant of case NUMBERONE. This factor corresponds to a change in stress from 539 psi to 717 psi.

The mechanical case however shows that the reactions do not distribute themselves as evenly (Largest factor from table 1 is 1.17323). The calculations still do not vary greatly from that of the static case. The largest deviation from the static case is 2.82 ksi in the bearing stress of the 3.5 inch bearing plate of case NUMBERFIVE. The largest factor for the mechanical case is 4.1489 and appears in the arm of quadrant 1. This factor corresponds to a change in stress from 1214 psi to 5038 psi.

HAND CALCULATIONS

Failure Stress Calculations

For all stress hand calculations for the Jack Failure Analysis of the Central Calorimeter Cradle, the most severe reaction force will be used along with Leo Engstrom's stress calculations from Engineering Note 3740.251-EN-14, which also contains all moment of inertia and static case calculations.

These diagrams will be referred to in all five cases and are defined in the above mentioned Engineering Note.
