Intrabeam Scattering Results for a
High Frequency RF System with Tight RF Buckets

G. Parzen

May 25, 1988

Factors Leading To Growth

$$1) \frac{1}{\sigma} \frac{d\sigma}{dt} \approx (Q^2/A)^2$$

2) Distance from "Equilibrium State"

$$\text{Invariant} \rightarrow \sigma_E^2 - \sigma_x^2 = \text{const}, \quad \sigma_E = \chi_p \sigma_p$$

$\chi > \chi_c$, cells only lattice, no coupling

$$t \rightarrow \infty, \quad \sigma_E \sim \sigma_x$$

$$\frac{1}{\sigma_E} \frac{d\sigma_E}{dt} = \left(\frac{\sigma_x}{\sigma_E} \right)^2 \frac{1}{\sigma_x} \frac{d\sigma_x}{dt}$$

If $\sigma_E \ll \sigma_x$ at $t=0$, the σ_E will grow much faster than σ_x until $\sigma_E \sim \sigma_x$.

Protons may show large growth in σ_E , if $\sigma_E \ll \sigma_x$ at $t=0$.

(2)

High Frequency RF System

To get shorter σ_z , suggests $f \sim 200 \text{ MHz}$

Earlier calculations required

large voltage $V \approx 40 \text{ MV}$, and gave large growth in ϵ_x, σ_p , by factor ≈ 2 .

Old Procedure

V held constant. V chosen large enough to contain bunch at $\delta = 100$; $\Delta_B = 2.5 \sigma_p$ at $\delta = 100$ after 10 hours.

New Suggested Procedure

V varied with time so that bucket just contains the bunch, $\Delta_B = 2 \sigma_p$ at all times.

For fixed σ_p / Δ_B , σ_z is constant.

$$\frac{\sigma_p}{\Delta_B} = \sin \phi/2$$

For $\Delta_B = 2 \sigma_p$, $\phi = 60^\circ = \frac{1}{3} \pi$

$$\sigma_z = \frac{1}{3} \ell_B$$

Proposed RF System

$$f = 160 \text{ MHz}, \quad h = 2052$$

$$\sigma_e = 31 \text{ cm}$$

$$A = .3 \text{ eV-rec}$$

$$\Delta_B = 2 \sigma_p$$

- 1) Increasing f will reduce σ_e
but will increase ϵ_x , σ_p and V
- 2) Increasing A will increase
 ϵ_x , σ_p , and V .
- 3) Increasing Δ_B / σ_p will reduce σ_e
and improve the safety (reduce
the losses from the bucket) but will
increase ϵ_x , σ_p and V
