This work was partially supported by the U.S. Department of Energy, Offices of Electricity Delivery and Energy Reliability under the Cooperative Agreement DE-FC36-99G010825, Contract W-31-109-Eng-38, and Sandia National Laboratories Energy Storage Program Contract 24412

Outline

Boeing Technology | Phantom Works

- Flywheel application description
- 5 kWh /100 kW FES design and test results
- Previous HTS bearing and cryogenic set-up and results
- Direct cooled bearing design and test results
- Description of direct cooled test set-up
- Summary

Boeing Flywheel Development History

Why Flywheels and Superconducting Bearings?

Boeing Technology | Phantom Works

• Why Pursue Flywheel Energy Storage?

- Non-toxic and low maintenance
- Potential for high power density (W/ kg) and high energy density (W-Hr/ kg)
- Fast charge / discharge times possible
- Cycle life times of >25 years
- Broad operating temperature range

Flywheel Energy Storage

• Why use HTS bearings?

- Simple passive system
- Very low frictional loss
- Very long lifetime
- Low cost and maintenance
- Lower tolerance for balancing of dynamic structures
- High speed capability (> 500,000 RPM)
- Adjustable stiffness and damping

Flywheel Energy Storage

Benefits of Using FESS Instead of Idling 2nd Generator on Standby

- Reduce Generator Maintenance by 50% (estimate)
- Reduce Fuel Costs by \$80k/yr (estimate)
- Lower Pollution

Key Issues for HTS Bearing Design

Boeing Technology | Phantom Works

- Overall efficiency needs to be >95% in operating range
 - Low loss superconducting bearing
 - No criticals in operating range
- System needs to be stiff enough to follow disturbances, yet not so stiff critical frequencies are produced in the operating range
 - Interactions between rotating portions (hub, spokes, & rotor)
 - Bearing stiffness
 - M/G stiffness
 - HTS damping J_c and temperature dependent
 - Cooling type parasitic losses, temperature
 - HTS samples size and superconducting properties

Boeing Flywheel Project Summary

Boeing Technology | Phantom Works

- Program goal is to design, develop, and demonstrate a 100 kW UPS flywheel electricity system
- Flywheel system spin tested up to 15,000 RPM in a sensorless, closed loop mode
- Testing identified a manufacturing deficiency in the motor stator – overheats at high speed, limiting maximum power capability
- Successfully spin tested direct cooled HTS bearing up to 14,500 RPM (limited by Eddy current clutch set-up)
- Testing confirmed commercial feasibility of this bearing design – Eddy Current losses are within acceptable limits
- Boeing's investment in flywheel test facilities increased our spin-test capabilities to one of the highest in the nation
