ABSTRACT

An experiment containing WG-MOX fuel has been designed and irradiated from 1998 to 2004 in the Advanced Test Reactor (ATR) at the Idaho National Engineering and Environmental Laboratory (INEEL). Important neutronics parameters were computed using novel Monte Carlo methods. The purpose of this summary is to compare the Weapons-Grade Mixed Oxide fuel (WG-MOX) Zr-tube's neutron spectrum in ATR and PWR. The results indicate that the Zr-tube's neutron spectrum in ATR are softer than in PWR.

WG-MOX FUEL ZR-TUBE NEUTRON SPECTRUM COMPARISON IN ATR AND PWR

INTRODUCTION

In support of potential licensing of mixed oxide (MOX) fuel made from weapons-grade (WG) plutonium and depleted uranium for use in U. S. reactors, an experiment containing WG-MOX fuel has been designed and irradiated from 1998 to 2004 in the Advanced Test Reactor (ATR) at the Idaho National Engineering and Environmental Laboratory (INEEL). A simple, uninstrumented, test assembly containing nine MOX fuel capsules with neutron monitor wires was inserted into the ATR reflector. Important neutronics parameters were computed using novel Monte Carlo methods. The purpose of this summary is to compare the Weapons-Grade Mixed Oxide fuel (WG-MOX) Zr-tube's neutron spectrum in ATR and PWR.

WG-MOX FUEL PIN MODEL IN ATR AND PWR LATTICE MODEL

The thermal neutron flux in the ATR reflector is dependent on the outer shim cylinder positions, the neck shim positions, and the depletion of the fuel and Boron-10 in the nearest lobe. The plan view of the small I-irradiation positions in ATR is shown in Figure 1. There are 3 MOX fuel test sections axially, with the center section at the core midplane, and 3 fuel capsules (SS-304L) in each section, for a total of 9 fuel capsules in the test assembly. Each capsule contains one fuel pin. Each fuel pin contains 15 MOX fuel pellets and each fuel pellet stack is 0.415 cm in radius and 15.24 cm in length. The fuel pellets are enclosed in 0.0686 cm thick Zircaloy cladding tubes. To meet the ATR safety requirement, then, Zircaloy cladding tube was enclosed in 0.1016 cm thick stainless-steel (SST) tube. A gap of 0.0025 cm separates the WG-MOX pellet from the Zircaloy cladding. The fill gas for the fuel pins and capsules was helium at atmospheric pressure. The radial view of the test assembly and capsule is shown in Figure 2. The WG-MOX fuel pellet contains 5.0 wt % PuO₂ with ²³⁹⁻²⁴²Pu represented with 93.6, 5.9, 0.4, and 0.1 wt % Pu, respectively.

A typical PWR unit cell has been chosen as the basis for the fuel neutronics burnup characteristics comparison with the WG-MOX fuel irradiated in ATR. A typical PWR 17 × 17 fuel-element array lattice with fuel pin-to-pin pitch of 1.43 cm was chosen as a reference case in this study.

RESULTS AND DISCUSSION

The comparison of the ATR with WG-MOX fuel at Beginning of Life (BOL) and End of Life (EOL), and the PWR unit lattice neutron flux spectra in the fuel pin is shown in Figure 3, which shows that the neutron spectrum in the ATR test position is somewhat softer than the neutron spectrum in a PWR. The MCNP¹-calculated WG-MOX fuel pin and Zr-tube's neutron spectrum in ATR with WG-MOX fuel at BOL and EOL, and PWR are plotted in Fig. 4, which also shows a softer neutron flux spectrum in ATR. Note that the major source of fast neutron of WG-MOX fuel capsule in ATR is coming from the WG-MOX fuel pin alone. Toward the end of WG-MOX irradiation life, the Pu-239 depleted about 92 atom%, which makes the Zr's tube neutron flux spectrum softer than the spectrum at the beginning of irradiation life. In addition, there is a significant portion of the fast neutron flux is coming from the adjoining pins in PWR, which make the Zr's tube fast neutron fluence rather higher than Zr's tube fast neutron fluence in ATR for the same MOX fuel burnup. The MCNP-calculated detailed results are also tabulated in Table 1.
