Sandia National Laboratories – Albuquerque
2006 Illness and Injury Surveillance Report

At A Glance

Sandia National Laboratories – Albuquerque (SNL) reported 327 absences among 2,629 women, resulting in an absence rate of 12 per 100 women (327/2,629). Among the 5,404 men, 347 absences resulted in an absence rate of 6 per 100 men (347/5,404). These rates have remained constant since 2003 for both men and women.

Absence rates increased with age among both men and women age 30 and above, and the absence rate among women was about twice the absence rate among men regardless of age.

The highest absence rate was noted in the Service group for women (32 per 100 women) and in the Crafts group for men (13 per 100 men).

Women lost 8,310 calendar days due to illness and injury. Musculoskeletal conditions (19 percent), respiratory conditions (15 percent), genitourinary disorders (14 percent), and injuries (11 percent) accounted for 59 percent of all reported diagnoses among women.

Men lost 7,301 calendar days due to illness and injury, 62 percent of which were due to injuries (18 percent), musculoskeletal conditions (17 percent), respiratory conditions (16 percent), and digestive disorders (11 percent).

Disorders of the musculoskeletal and respiratory systems and injuries have consistently been the most frequently reported across the DOE sites participating in the Illness and Injury Surveillance Program (IISP) since 1995.

Of 11 possible occupational sentinel health events, 10 diagnoses were carpal tunnel syndrome. Four of these were reported by workers in the Professional category. The remaining 6 were spread among 4 occupational groups.

The rate of OSHA-recordable health events was 3 events per 100 for women and 2 events per 100 for men.

Since 2003, SNL OSHA event rates have tended to remain steady. This is in contrast to the decrease in OSHA event rates seen among the DOE sites participating in the IISP from 1995 to 2004.

The total number of lost or restricted workdays was 1,787 for 2006. The number of lost or restricted workdays has been declining since 2003, when there were 2,305 workdays lost or restricted.
The number of injuries decreased by 15 percent from the total in 2005, reflecting more than a 50 percent reduction in complications and unspecified injuries. Both men and women showed a substantial decrease in the number of complications and unspecified injuries, predominantly reported by workers in the Professional and Administrative Support job categories, followed by Security and Fire workers.

The OSHA-recordable rates were highest among male and female Security and Fire workers. With the exception of Security and Fire workers, OSHA rates for each job category have remained steady or decreased since 2003.

Sentinel Health Events for Occupations (SHEOs)

An occupational sentinel health event (SHEO) is a disease, disability, or death that is likely to be occupationally related. Although sentinel health events may indicate an occupational exposure, many may result from nonoccupational exposures. Sentinel health events are therefore assessed in two categories:

*Definite Sentinel Health Events:* Diseases that are unlikely to occur in the absence of an occupational exposure (e.g., asbestosis).

*Possible Sentinel Health Events:* Diseases that may be occupational but can also occur in the absence of an occupational exposure (e.g., lung cancer or carpal tunnel syndrome).
