# 1. Introduction

The overall goal of conducting a SAPHIRE version 8 "Independent Verification and Validation" (IV&V) activity is to provide a process to support the Nuclear Regulatory Commission (NRC) in ensuring a high-quality software development process and product through a formal process.

Use of the NRC's Standardized Plant Analysis Risk (SPAR) models may be required in some of the tests. *SPAR models are designated Official Use Only and are to be treated as not publically available.* 

# 1.1. Purpose

The SAPHIRE team is improving the software development process by conducting IV&V activities. The SAPHIRE IV&V process echo's the development process. IV&V is beneficial to the overall development process if it is conducted once the software code base is mature such that the verification takes place shortly prior to what the end users will see in a production version.

What is the definition of IV&V and why is it performed?

Normally, IV&V is the verification and validation of a software product by an organization that is both technically and managerially separate from the organization responsible for developing the product.

- Verification is the process that determines if a product meets its requirements (Are we building the right SAPHIRE product?).
- Validation is the process that determines if a product performs its intended activities (Are we building the SAPHIRE product right?).

In general, IV&V is part of the testing process. It should echo or adapt to the characteristics of the software development methodology being followed. Since SAPHIRE 8 is an 'Object Oriented' approach, each object needs to be examined as it moves through the phases of the development cycle.

Some of the high level benefits of performing IV&V include but are not limited to:

- Visibility into development
- Improved decision criteria
- Alternate technical source
- Reduced maintenance cost
- Reduced frequency of change
- Improved software performance
- Improved confidence in the reliability of the software
- Documents the compliance between the requirements specification and the code

Past SAPHIRE IV&V processes were conducted on IRRAS versions 4 and 5. SAPHIRE version 7 was not formally tested through an IV&V process due to the use of automated tests

(some of which replicate older IV&V tests) as part of the development process. These older IV&V processes and documents will be reviewed for applicability and insights as part of the initial phase of the SAPHIRE 8 IV&V team.

# 1.2. Objectives and Goals

SAPHIRE 8 is being developed with a phased or cyclic iterative rapid application development methodology. Due to this approach, a similar approach should be taken for the IV&V activities on each vital software object. IV&V and SQA activities occur throughout the entire development life cycle and therefore, will be required through the full development of SAPHIRE 8. Later phases of the software life cycle, the operation and maintenance phases, are not applicable in this effort since the IV&V is being done prior to releasing Version 8.

The IV&V plan is structured around NUREG/BR-0167, "Software Quality Assurance Program and Guidelines," February 1993. The Nuclear Regulatory Research Office Instruction No.: PRM-12, "Software Quality Assurance for RES Sponsored Codes," March 26, 2007 specifies that RES-sponsored software is to be evaluated against NUREG/BR-0167. Per the guidance in NUREG/BR-0167, SAPHIRE is classified as "Level 1." Level 1 software corresponds to technical application software used in a safety decision.

Previous verification and validation of SAPHIRE have also utilized the IEEE Standard for Software Verification and Validation. The SAPHIRE testing, verification and validation (TV&V) process currently in place had also been compared to the IEEE standard. From this comparison, four key recommendations were developed:

1. Reach a consensus on the target software integrity level [1, 2, 3, or 4].

2. Create a formal Software Validation and Verification Plan document that describes which V&V activities will be performed, and which will not.

3. Utilize a functionally independent (from the developmental organization) V&V person(s) for at least some V&V functions.

4. Perform a V&V audit by a non-INL entity. This audit could be conducted once a year and could be performed by a NRC employee not directly associated with the SAPHIRE development project.

This plan is designed to satisfy recommendation 3. The SAPHIRE 8 IV&V team will be following this IV&V plan.

The IV&V plan follows the Table 1, "IV&V Tasks Based on NUREG/BR-0167" given at the end of this document. A checklist has been developed to implement the Table 1 tasks and products, and is attached. The checklist provides comprehensive coverage of NUREG/BR-0167 V&V activities. A comparison of the checklist to the NUREG/BR-0167 Table 3-1, "Verification and Validation Activities by Major Life Cycle Activity," shows that V&V activities associated with Requirements Definition, Design, Implementation, Qualification Testing, and Installation and Acceptance Testing are planned to be checked. Since SAPHIRE 8 is not yet in maintenance

or operations, the V&V activities are not yet applicable. However, if schedule and budget permit, the IV&V will also check on plans to maintain the software. In addition to the life cycle phases given in NUREG/BR-0167 Table 3-1, the checklist covers the software project plan, project tracking and oversight, configuration management, and risk management which are included elsewhere in the NUREG. Furthermore, tasks and products associated with both NUREG/BR-0167 and IEEE STD 1012-2004 are included in this IV&V effort as shown in Table 1 of this plan. Therefore, this IV&V plan comprehensively covers NUREG/BR-0167 and includes some tasks and products associated with the IEEE STD 1012-2004.

Since the testing phase comes after the other phases, it is important that the IV&V remain within schedule and budget to ensure the testing activities specified in the plan will be completed. Potential deviations from the plan will be brought to the NRC's attention. Additional activities may be pursued if schedule and budget permits.

The IV&V is complemented by other V&V activities. The NRC's internal peer review will review requirements and design documents, and will test a beta version of the software. In addition, beta testers are testing the software and NRC audits are performed against NUREG/BR-0167.

The comparison report found that SAPHIRE TV&V practices most closely satisfied the IEEE standard's Level 1 tier, and in some cases the practices were felt to match higher level tiers.

The actual integrity level of a software project should be decided upon via mutual agreement between the customer and the code developers The IEEE V&V describes a set of life cycle processes (e.g., management, development, maintenance) to which the standard applies. It notes that only those life cycle processes used by a software project need comply with the standard. Table 1 below briefly describes the life cycle processes defined in the IEEE standard, and their applicability to SAPHIRE project.

The IEEE development portion of the IEEE life cycle process closely corresponds to the NUREG/BR-0167 software life cycle description. This NUREG recognizes that each software project must tailor the life cycle processes to fit the scope of effort, using cost-effective management and judgment.

Life cycle		Used by
process	Description	<b>SAPHIRE?</b>
Management	Overall handling of the software project	Yes
Acquisition	Request for proposal; selection of a supplier;	Limited
	acceptance of software product	applicability
Supply	Proposal preparation; development of project	Limited
	plans; delivery of product	applicability
Development	Requirements analysis; design; coding;	Yes
	integration; testing; installation and acceptance	
Operation	Operation of the product and support to users	Yes
Maintenance	Modifications due to problems or need for	Yes
	improvement	

Table of IEEE standard life cycle and applicability to the SAPHIRE development process.

Error Consequence	Likelihood of occur	rrence of an opera	ating state that conti	ributes to the error
	Reasonable	Probable	Occasional	Infrequent
Catastrophic	4	4	4 or 3	3
Critical	4	4 or 3	3	2 or 1
Marginal	3	3 or 2	2 or 1	1
Negligible	2	2 or 1	1	1

#### IEEE software integrity levels.

#### IEEE definitions of consequence.

Consequence	Definitions
Catastrophic	Loss of human life, complete mission failure, loss of system security and safety, or
	extensive financial or social loss.
Critical	Major and permanent injury, partial loss of mission, major system damage, or major
	financial or social loss.
Marginal	Severe injury or illness, degradation or secondary mission, or some financial or social
	loss.
Negligible	Minor injury or illness, minor impact on system performance, or operator
	inconvenience.

SAPHIRE is at IEEE integrity level "1", the lowest. If one examines the IEEE software integrity level table, SAPHIRE can be assigned an IEEE-1012 level of 1 and still be critical to supporting the decision-making process. Because SAPHIRE is not the only tool used to support the decision-making process it should not be classified as "Catastrophic." Furthermore, no metrics to support an IEEE-1012 classification higher than a "1" currently exist. The results of any calculation information from SAPHIRE depend largely on how a model has been implemented by a user. A process exists to analyze all errors reported by the user community.

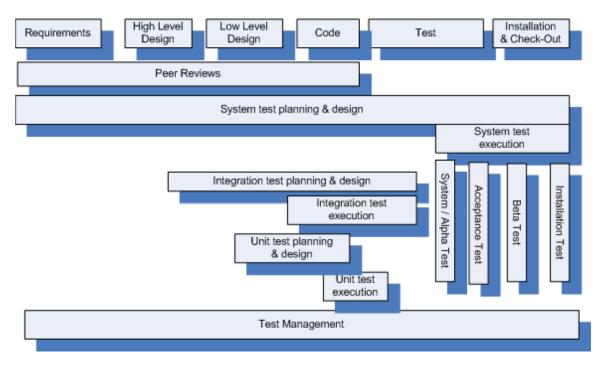

The IEEE standard levels are based on considerations of 1) the likelihood of occurrence of an operating state that contributes to the error, and 2) error consequence. IV&V activities in this plan which correspond to the IEEE software standard should be done at the level 1 tier. More rigorous reviews may be considered at higher levels for life cycle activities such as "Implementation" and/or "Test" if the schedule and budget permit. Therefore, the IV&V plan, while based on the governing document, NUREG/BR-0167, also considers how the review activities and products correspond to the current IEEE software standard. The NUREG/BR-0167 also requires an IV&V test report upon completion of the development

efforts. For meeting NUREG/BR-0167 requirements, there also needs to be an SQA interface with the development team. This individual will also interface with the IV&V representative.

Each developer is responsible for ensuring that the code they create has met the criteria discussed in the NUREG/BR-0167. According to the contract that the INL holds with the NRC, SAPHIRE 8 is supposed to be brought up to "state of the art" software. This means that activities that are called out in the NUREG/BR-0167 not currently being performed by the developers should be modified so that they are brought in compliance. If required, additional support tasks may need to be incorporated into the development process. Some tasks are the responsibility of the developers to incorporate into their code. Other tasks could be done by support personnel such as a software technician. A subject matter expert familiar with PRA modeling techniques needs to be available for consultation. Due to finite programmer resources supporting the SAPHIRE effort, automated analysis tools may be purchased to support QA and IV&V activities and improve the analysis process.

A distinction needs to be made for clarification of IV&V activities. Verification and validation activities encompass all activities that the developers and testers, software quality assurance representatives and independent auditors perform to ensure a quality software application (see Figure 1 for an overview of typical testing activities). Each participant has specific roles and responsibilities based on the function being performed by the individuals. In this plan, it was attempted to delineate the expected inputs and outputs between the developers and SAPHIRE 8 team members as compared to the IV&V team members.

For each functional area, the tasks outlined in the NUREG/BR-0167 Software Quality Assurance Program and Guidelines will be noted. If, upon review, an item is found to be lacking, an action plan will be implemented to take corrective action and monitored until corrected or explained. Not every item listed will be applicable to each major functional area. Further, not all comments will need to be resolved prior to a general release of SAPHIRE 8 – minor issues and recommendations may be addressed during a later release of the software. The NRC will make these determinations.

#### Figure 1. General Testing Activities and the Software Life Cycle.

Figure 1 maps the basic phases of software development and the types of testing possible during the life cycle of a software application development effort. The SAPHIRE 8 development team is not performing every type of test that is indicated in the figure. The SAPHIRE team has selected certain test phases as the most effective approached to the testing effort. See Table 1 IV&V Tasks Based on NUREG/BR-0167 for the specific test phases to be performed. The IV&V Team will witness all or a portion of the tests and inspect the results of the tests performed by the development team. Additional analysis and indication of needed test effort may be required by the IV&V Team as part of the overall verification and validation effort and to

provide customer confidence in the new software release. See Table 1 IV&V Tasks Based on NUREG/BR-0167 for a break out of specific products required for by the development team and the IV&V team to support the SAPHIRE 8 V&V effort.

# 2. Referenced Documents and Sources

Applicable sources of information that will be available to the IV&V team include:

- Access to personnel staffing the development team
- Source code stored in the revision control system
- Beta test feedback stored in the change log system
- NRC Form 173s
- NRC Form 189s
- General INL project information (e.g., monthly reports)
- Automated tests and QA results
- SAPHIRE Verification and Validation Plan, Volumes 1 and 2
- Module design documentation
- SAPHIRE 8 New Features and Capabilities document
- User feedback checklists
- Design review documentation
- Past IV&V reports, including prioritization of key features
- SAPHIRE 8 Source code.
- SAPHIRE 8 Software Requirements, Design and Test documentation
- NUREG/BR-0167 Software Quality Assurance Program and Guidelines
- NUREG/BR-0167 SQA Audit Check Sheet
- IEEE-1012 2004 Standard
- SAPHIRE Modeling & Analysis Software Compliance to Requirements Assessment Checklist

# 3. IV&V Overview

This section discusses the project organization, schedules, resource allocation and tools, techniques, and methodologies.

# 3.1. Organization of IV&V Activities

The Table 1, "IV&V Tasks Based on NUREG/BR-0167," provides the list of activities to be performed by life cycle phase. As can be seen in this table, certain activities also correspond to activities in the IEEE software standard. The checklist developed for the NRC audits of SAPHIRE can be found in the Revision Control System (RCS). This checklist may be useful for the IV&V team to consult, but does not replace the activities and products given in the table which are to be completed.

The key functional areas of focus for the IV&V team are shown in Figure 2. The team, which will be selected during the initial phase of the IV&V, will focus on vital aspects of these key areas. Vital aspects, new or carried over from the previous SAPHIRE version 7, will be included in the IV&V. Non-vital aspects should also be included in the scope of the IV&V; however, the focus should be on the vital aspects.<sup>1</sup>

Note that the team members will have a variety of backgrounds (e.g., QA, PRA). The SAPHIRE 8 IV&V team is looking for "functional" independence (from the SAPHIRE development project) for team members. Consequently, INL staff that work on other NRC projects or that have used SAPHIRE in the past can be considered for the IV&V team.

<sup>&</sup>lt;sup>1</sup> For the V&V of SAPHIRE Version 5 (as described in NUREG/CR-6116 Volume 9), a "vital feature" was defined as those that (a) affected the results of a PRA and (b) are essential for completing a PRA analysis.

The SAPHIRE 8 graphical user interface (GUI) is implemented using a modern Windows-design environment which allows for multiple, resizable forms. Functionality for the previous GEM and SAPHIRE interfaces will be accessed from within SAPHIRE 8. The GUI is coded in Delphi and object Pascal.

The GUI has a top-level main form that allows the user to choose between model development or to perform an analysis. Under the model development option, the user will be able to select a fault tree logic diagram, an event tree logic diagram, basic events, end states, or a project workspace.

When a user performs an analysis, a copy of the relational database files are created and stored in a unique workspace folder in the workspaces directory. Once the analysis is complete (i.e., saved) the relational database files will be compressed into a single .zip file. The compressed file may be shared with another user if desired. The uncompressed file may be opened at a later time and the database reviewed to inspect the analysis. Currently, three types of workspaces are available: General, SDP, and Events and Condition Assessment (ECA). The analysis process, reports, and results are customized specific to each type of workspace.

A variety of enhancements have been implemented in SAPHIRE 8. For example, SAPHIRE has a more powerful cut set slicer, supports compressed files, allows users to assign macros to on-screen buttons, contains a better graphing package, and uses HTML-based report templates.

Analysis improvements have been implemented. In SAPHIRE 7, different "types" of models were stored in select analysis type parts of the database such that aggregate results were not available. In SAPHIRE 8, the user may define up to 32 "model types" (e.g., full power internal events, low power internal events, seismic events, and flooding events) such that this information is shareable within a single project enabling aggregate (or single if needed) risk assessment.

To support the development of "integrated models" (models with multiple model types), features such as an "accident sequence matrix" are used to enable the development of external events models via a semi-automated process. The fault tree model editor has been designed to be aware of the different model types and will show the user which events (and their respective probabilities) apply to the individual model types.

In SAPHIRE 8, the user now has the ability to search (in text fields such as names and descriptions) on objects in the project database, thereby facilitating a way to quickly find information in large project.

# 3.2. Schedule of Activities

The IV&V functions can commence upon receipt of funding and will last approximately eight months. An approximate schedule is presented below in Schedule and Products, assuming a March start (a later start will push the timetable back by the delay time). For example, the first area targeted will be the core functionality of model construction and examination of the updated and existing SAPHIRE 8 capabilities. This includes construction of Basic Events, Fault Trees, Event Trees, and End States. Since this is the core of the SAPHIRE application and will support

any additional functionality, performance of SQA and IV&V as early as possible will insure a solid review for future use of the software.

### **Key Areas**

- 1. Model Construction
- 2. Standard Analysis Interface
- 3. Workspace Analysis Interfaces
- 4. PRA Quantification
- 5. General Support Features and Capabilities

### **Schedule and Products**

T0 - IV&V team selection and finalize IV&V plan, including prioritization of activities. Final test plan must be approved by the NRC Project Manager.

Period: March, 2009 Product: IV&V plan including comments from IV&V team

T1 – Requirements, Design, Implementation Review, IV&V assessment

Period: April – July, 2009

Products: Monthly progress reports; IV&V products in the table; draft report sections for final report. Checklist review (e.g., requirements, design, implementation, etc.), IV&V assessment. Note: Some IV&V observation/evaluation/testing can begin.

> Checkpoint: NRC assesses progress and determines if additional IV&V time is needed

Milestone: Version 8 beta 4 ready for IV&V testing completed by end of June, 2009. NRC will review this version to ensure it is ready for IV&V testing prior to it being provided to the IV&V team in July. This version will not include algorithmic improvements for SAPHIRE calculation speed.

 $T2-\mbox{Test},$  Installation and Checkout

Period: August 2009 – January 2010

Products: Monthly progress reports; IV&V products in the table; draft report sections for final report.

> Checkpoint: NRC assesses progress and determines if additional IV&V time is needed

Product: Final Report – January 2010 or later as specified by NRC Project Manager based on NRC assessments. Checklist review (e.g., testing, installation and checkout, etc.)

Note: IV&V observation/evaluation/testing to be completed. In addition, the development team is utilizing a rapid application, spiral methodology approach for software development. Therefore some criteria in the checklist may need to be reassessed and reviewed to complete any remaining life cycle phases.

Milestone; Version 8 beta 5 ready for NRC review by end of January 1010

#### T3 – SAPHIRE Development Team Finalizes Version 8 for release

Period: February, 2010 - March, 2010

#### Management

NRC approval is necessary for

- the final IV&V plan
- changes in scope, level of effort, or schedule
- acceptance test plan developed by the development team for the vital and non-vital aspects prior to beginning the test phase (T2)
- determining which major IV&V team recommendations to resolve before releasing Version 8 (it is recognized that not all recommendations will need NRC approval for resolution)

Detailed monthly progress reports will be provided to the NRC Project Manager and Technical Monitor.

The INL SAPHIRE development team will respond to IV&V findings, as appropriate, as the IV&V review is being done. Additional time (T3) will be available to the SAPHIRE development team after completion of the Final Report to allow the team to finalize Version 8 for release.

### 3.3. Resource Summary

The IV&V personnel will consist of one "Full Time Employee" assigned to act as the IV&V Lead. This person is an experienced developer or QA engineer that has not developed code specifically for SAPHIRE 8.

Two additional <sup>1</sup>/<sub>2</sub> time support persons on an as needed basis for performing some the IV&V activities. This may include but is not limited to subject matter experts, software technicians or student interns. All personnel will be required to read this document and be familiar with the software development methodology. These roles may last for a few days or a few weeks depending on the need. A resume of all personnel utilized in this effort will be on file.

All test equipment needed currently resides at the INL.

# 3.4. Tools, Techniques and Methodologies

The tools to be utilized in the SAPHIRE 8 IV&V process are:

Windows XP Professional Desktop computer with all current security patches SAPHIRE 8 executable installed on the Windows computer Component Software Revision Control Software tool (CS-RCS) SAPHIRE automated test suite Code Healer Software Analysis Tool Version 2.5 SOCK software Delphi 2007 Software Development Environment MS Word Processor SPAR models Delphi and Modula-2 Coding Standards

Techniques and methodologies will include code review of randomly chosen source code files against the NUREG/BR-0167 standard, Code Healer analysis of randomly chosen sections of the software, tracing of randomly chosen functional areas from requirements to final test results. Possible auditing of any and all documentation pertaining to design reviews, software change processes or other pertinent SAPHIRE 8 processes and products.

# 4. Completion and Deliverables for the IV&V Activities

The basic high level functional areas will be examined in the order listed. This will echo the application development and provide immediate feedback while the code is still being developed and tested; and provide a solid basis for further interface and development for the next iterative cycle. See Table 1 for the high level focus areas. For the high level areas, the IV&V team will be reviewing and testing as described in the NUREG/BR-0167 and IEEE STD 1012-2004 (IEEE STD 1024-1998 has been superseded) as a secondary reference where applicable. See Section 3.2 for the high level breakdown of the SAPHIRE 8 IV&V focus.

For each functional area, the tasks outlined in the NUREG/BR-0167 Software Quality Assurance Program and Guidelines will be accounted for. If upon review an item is found to be lacking, an action plan will be implemented to take corrective action and monitored until corrected or explained. Not every item listed will be applicable to each major functional area.

Table 1 lists all the expected tasks and deliverables to support this activity. Since the IV&V echoes the development process, as each vital feature for key areas are complete, the corresponding IV&V activities should commence. If the development is delayed, the IV&V activities must be delayed as well.

The key deliverable will be the final IV&V report listing the results of the IV&V process. This report will provide input to the SAPHIRE developers in order to focus future software development. This report will focus on what modifications should be considered in order to ensure SAPHIRE Version 8 is a quality product. The NRC will review these suggestions and, in conjunction with INL feedback, prioritize the suggestions for resolution. An overview of the

IV&V process and results will also be summarized as a chapter in the SAPHIRE SVVP document.

# 4.1 Final Report Format

For each IV&V Review Area evaluated, the IV&V Review Report should contain the status of the SAPHIRE 8 Project, including any pertinent historical background information. The report should also contain a detailed analysis of each applicable IV&V Review Area, which answers at least the following questions:

- What are the current processes, procedures, practices and technology?
- What is good about the current processes, procedures, practices and technology?
- What about the current processes, procedures, practices, and technology needs improvement?
- What are the test results and insights?
- Is the project documentation accurate and up-to-date?
- What deviations from the IV&V plan exist and are they reported?

Here are the sections that will be presented in the SAPHIRE 8 Software Independent Verification and Validation Review Report

- Section 1 Executive Summary
- Section 2 Background Information
- Section 3 Project Summary
- Section 4 Summary of Findings
- Section 5 Summary of Analysis
- Section 6 Summary of Recommendations
- Section 7 Summary of Best Practices
- Section 8 Summary of Lessons Learned
- Attachment 1: List of Personnel Contacted
- Attachment 2: List of Documents Reviewed
- Attachment 3: List of Software Test Tools and Tool Descriptions
- Attachment 4: Detailed Findings and Recommendations Table
- Attachment 5: Project Best Practices
- Attachment 6: Project Lessons Learned

Note – IV &V will generate independent tests and review developer test processes, test suite , and test results as specified in this plan.

#### The following checklist items are provided at a level of rigor that is intended to:

1) Provide sufficient information to NRC for audit purposes.

2) Update artifacts to begin a path forward for further improvements to meet good software engineering practices commensurate with NRC and industry standards.

3) Conduct IV&V in a cooperative environment with developers. It is not the intent that IV&V be conducted in an "adversarial" environment. IV&V and the developers must work as a team to be successful. Should issues arise that cannot be resolved between IV&V and the developer, the issue(s) can either be resolved by the NRC sponsor or identified in the checklist with developer and IV&V differences addressed in the comments section of the checklist.

4) Identify the IV&V test effort. IV&V will not conduct independent testing and also will evaluate and observe the developer's tests to ensure they are complete and accurate and that the test processes are met according to the approved documentation. The applicable IEEE integrity level is level 1; however, the IV&V may consider IEEE testing activities (or other activities) at a greater level given the schedule and budget constraints.

5) The checklist comprehensively covers NUREG/BR-0167. Some tasks performed in a "full-up" IV&V effort as identified in industry standards, such as IEEE, will not be performed. IV&V tasks will be identified in the IV&V Plan and developed in a coordinated effort with the developer and the sponsor

6) Only those checklist items that are applicable (as agreed between the developer, sponsor, and IV&V) will be evaluated. This checklist is only a guide and some of the checklist items may be N/A. However, during the assessment process, checklist items may precipitate additional items that will be incorporated into this checklist. Checklist items are also prioritized to help meet schedule and budget constraints.

7) Provide information in the comments for EVERY checklist item. Comments must identify the location (e.g., RCS) for criteria that "Pass" for use as objective evidence of the review. The intent for using the checklist is not only to identify issues (i.e., "Fail") but also any "exceptional" practices. Explanations for N/A criteria must also be identified.

8) Each of the criteria in the checklist is prioritized. High priority is "1", medium priority is "2", and low priority is "3"

This checklist does not require that the assessment items be conducted as provided in the order below.

	SOFTWARE PROJECT PLAN
Criteria	Has the developer created a Software Project Plan?
Priority: 1	NUREG/BR-0167 Section 4.2 and 5.2.4
Pass	Comments
Fail	
N/A	
Criteria	Does the Project Plan provide project background and objectives?
Priority: 1	NUREG/BR-0167 Section 5.2.4
Pass	Comments
Fail	
N/A	
Criteria	Has the Project Plan address plan scope and organization?
Priority: 1	NUREG/BR-0167 Section 5.2.4
Pass	Comments
