HYDROGEOCHEMICAL AND STREAM-SEDIMENT SURVEY (NURE)

Preliminary Report on the Winnemucca Dry Lake Basin Pilot Study
(NEVADA)

August 1, 1976

This is an informal report intended primarily for internal or limited external distribution. The opinions and conclusions stated are those of the author and may or may not be those of the laboratory.

Prepared for U.S. Energy Research & Development Administration under contract No. W-7405-Eng-48.

metadc958172

This report was prepared as an account of work sponsored by the United States Government. Neither the United States nor the United States Energy Research and Development Administration, nor any of their employees, nor any of their contractors, subcontractors, or their employees, makes any warranty, express or implied, or assumes any liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product or process disclosed, or represents that its use would not infringe privately owned rights.

PRELIMINARY REPORT ON THE WINNEMUCCA DRY LAKE BASIN PILOT STUDY

INTRODUCTION

The Lawrence Livermore Laboratory (LLL) is conducting a hydrogeochemical and stream-sediment survey in the seven western states as part of ERDA's National Uranium Resources Evaluation (NURE) Program. The objective of this survey is to develop a geochemical data base for use by the private sector to locate regions of anomalous uranium content. Prior to wide area coverage, several pilot studies are being undertaken to develop and evaluate sampling and analytical techniques. The second through fifth of these studies were conducted in four playa basins in Nevada, selected to represent different regional geology and uranium occurrence. This study in the Winnemucca Dry Lake Basin, located on Figure 1, characterizes igneous surface geology with known uranium occurrences.

Winnemucca Lake is surrounded by the igneous environment of the mountains of the Lake Range on the west and the Nightingale-Selenite Range on the east. Fifteen known uranium occurrences exist over a large area on the east side of the basin. They are commonly vein deposits of secondary uranium minerals in metamorphic rocks near or in granite, pegmatites, or in Tertiary volcanic rocks. The basin includes drainage from an area of 356 square miles. Results of

this study are particularly applicable to the western Basin and Range igneous metallogenic province, which includes southeastern Oregon, western Nevada, and southeastern California.

This report contains only the analytical data and sample locations. Details of the sampling methods and equipment, analytical sensitivity, errors, interferences, and geochemical interpretation will be reported separately.

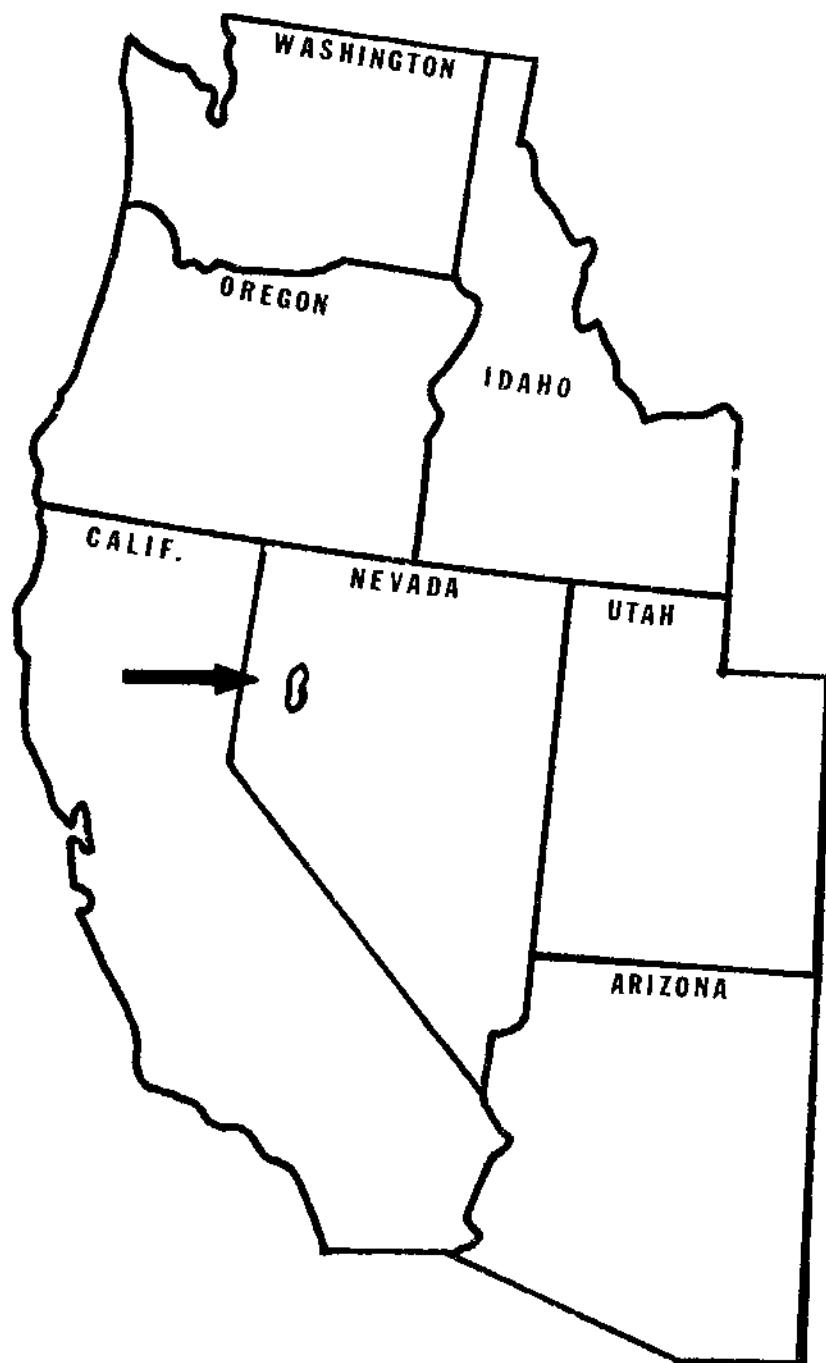

FIGURE 1: LOCATION OF WINNEMUCCA DRY LAKE BASIN

SAMPLE COLLECTION AND TREATMENT

Samples of the playa were collected at various depths to ten feet from shallow hand-drilled holes. Sediment samples were obtained from dry stream beds and alluvial fans which surround the playa. Relatively unweathered rock judged to be characteristic of the locale was also collected near many of the sediment sampling locations. In addition, all of the flowing streams, springs, and active wells which could be found were sampled. The pH, temperature, dissolved oxygen, eH, alkalinity, phenolphthalein alkalinity, and carbon dioxide were measured in-situ on filtered but otherwise untreated samples. Collected samples were filtered through a 0.4 μm pore membrane and one portion acidified to pH \sim 1.0 with HNO_3 in the field and the other untreated.

In the receiving laboratory the sediments were dried and the portion passing through a 1000 μm sieve, but retained on a 500 μm sieve, was analyzed. The playa samples were similarly handled except that they were first blended and the "cake" formed on drying was pulverized before sieving. Essentially all of the playa material passed through the sieve. Rocks were ground and passed through a 250 μm mesh sieve before analysis. Unacidified water samples were analyzed for chloride and sulfate content. Trace element analysis was performed on the residue of the acidified water samples. Archival samples were retained from all material collected.

Locations of water, rock, and sediment samples are shown in Figure 2, and locations of the playa samples are shown on Figure 3. These figures are scaled to the 1:250,000 AMS maps, Reno NJ 11-1 and Lovelock NK 11-10. The Universal Transverse Mercator grid (for Zone 11) is indicated on the figure.

CHEMICAL ANALYSIS

All data in this report except for the water measurements discussed above were obtained by neutron activation analysis using the Livermore Pool-type Reactor. Samples were counted after predetermined decay periods following irradiation. The counting data were converted to elemental concentration data by use of a computer code which also derived an estimate of the statistical errors. Other errors are not specified.

DATA PRESENTATION

Results of the study are presented in the appended six tables. Each table is divided into two parts, the first of which gives the site number, its location by UTM coordinates, and the field measurement data. The second part contains the site number and neutron activation analytical data. The tables are titled and numbered as follows:

Title	Location & Field Data	Analytical Data
Streams	1.1	1.2
Spring and Well Water	2.1	2.2
Playa Samples	3.1	3.2
Sediments, Wet Sites	4.1	4.2
Sediments, Dry Sites	5.1	5.2
Rocks	6.1	6.2

Certain sites were revisited during different parts of the season and replicate samples collected. These appear in the N.2 tables, with a four-letter sample type and treatment code followed by a numeral.

Zero indicates the first sample; 1-the second, or duplicate; 2-the third, etc. The sample type and treatments applicable to this study are: SW-wet sediment; SD-dry sediment; WW-well water; WR-river and stream water; WS-spring water; RO-rock; NO-no treatment; DS-dried and sieved; and LA-large acid. The sampling depth, in feet, of playa material is indicated by the two numbers following the SP (playa) code.

The location and field measurement tables have the site number, UTM coordinates, date collected, and data as described below.

Field Measurements

H₂O TEMP: Measurement of water temperature, in situ, by mercury thermometer to nearest 0.1 degree C.

pH: Acidity in pH units, reported to nearest 0.1 pH unit at ambient water temperature.

TOTAL ALK: Measurement by titration to a bromcresol green-methyl red indicator endpoint (pH = 4.8) with acid. Reported as an equivalent amount of CaCO₃ in mg per liter.

PHENO ALK: Measurement by titration to a phenolphthalein indicator endpoint (pH = 8.3) with acid. Reported as an equivalent amount of CaCO₃ in mg per liter.

DISS CO₂: Measurement by titration to a phenolphthalein indicator endpoint (pH = 8.3) with base. Determination is not made if pH > 8.3. Reported as equivalent dissolved CO₂ in mg per liter.

DISS 02: Measurement with a commercial dissolved oxygen meter. Accuracy is estimated to be \pm 0.1 ppm.

EH: Measurement with a portable commercial EH meter. Reported in millivolts, referenced to a standard calomel electrode at 25 degrees C.

Laboratory Measurements

COND/LAB: Measurement with a commercial conductivity meter. Reported as specific conductivity in micromhos per cm ($\mu\text{mho}/\text{cm}$) at 25 degrees C.

CHLORIDE: Measurement of the chloride content reported in parts-per-million (ppm). Detection limit estimated to be 5 ppm; accuracy \pm 10 ppm.

SULFATE: Measurement of the sulfate content reported in parts-per-million (ppm). Detection limit estimated to be 10 ppm; accuracy \pm 20 ppm.

In the neutron activation analytical data tables the site number, date collected, sample type and treatment, and uranium content are always listed as the first four columns of each page, followed by other trace elements. The other elements are listed alphabetically and are: Sb, As, Ba, Br, Ca, Ce, Cs, Cr, Co, Au, Hf, Fe, Mo, K, Na, Sr, Ta, Th, W, Zn, and Zr. These are divided in groups of four to a page so each table contains several repetitions of the site information and uranium columns. The data tabulated are parts by weight of the element, with the symbols PPK, PPM, PPB, and PPT standing for parts per thousand, million, billion, and trillion, respectively. Those cases where no value is listed indicate that the measurement was below the limit of detection for that specific sample. Because of variation in measurement conditions, the limit of detectability fluctuates, and thus a missing value is not necessarily smaller than the smallest value listed for some other sample.

It must be emphasized that this data is preliminary and may contain undetected errors. No warranty of accuracy can be implied or is intended. The user must be aware that any conclusion he may draw from it is entirely and totally his own, and that neither the LLL nor the University of California accepts any liability for costs incurred by a user because of such errors.
