ABSTRACT

WATEQF is a FORTRAN IV computer program that models the thermodynamic speciation of inorganic ions and complex species in solution for a given water analysis. The original version (WATEQ) was written in 1973 by A. H. Truesdell and B. F. Jones in Programming Language/one (PL/1). With but a few exceptions, the thermochemical data, speciation, activity coefficients, and general calculation procedure of WATEQF is identical to the PL/1 version. This report notes the differences between WATEQF and WATEQ, demonstrates how to set up the input data to execute WATEQF, provides a test case for comparison, and makes available a listing of WATEQF.

INTRODUCTION

WATEQF is a FORTRAN IV computer program that models the thermodynamic speciation of inorganic ions and complex species in solution for a given water analysis. The original version (WATEQ) was written by Truesdell and Jones (1973) in Programming Language/one (PL/1). With but a few exceptions, the thermochemical data, speciation, activity coefficients, and general calculation procedure of WATEQF is identical to the PL/1 version. For discussion of the program theory and original source of most of the thermochemical data, see Truesdell and Jones (1974). It is the purpose of this report to note the differences between WATEQF and WATEQ, demonstrate how to set up the input data to execute WATEQF, provide a test case for comparison (Attachment A), and make available a listing of WATEQF (Attachment B). This report also provides a list of all equilibrium reactions that are considered (Attachment C).

DIFFERENCES BETWEEN WATEQF AND WATEQ

1. In addition to the 100 aqueous species used in the WATEQ aqueous model, WATEQF includes 14 species of manganese and computes saturation data for 21 manganese minerals. See Table 1 for the thermochemical data used.
2. All reference to maximum and minimum estimates of log K used by WATEQ have been omitted in WATEQF.
3. In addition to calculating p_e from dissolved oxygen and Eh, p_e can also be set by the dissolved oxygen relation of Sato (1960) and by the $SO_4^{=}$ / $S^{=}$ ratio.
4. The carbon-bearing species are computed from either titration alkalinity, carbonate alkalinity, or total carbon in solution.
5. An option has been added that allows calculation of activity coefficients of charged ion pairs from either the Debye-Hückle equation or the Davies equation.
6. Thermodynamic data used in the program can be changed through the use of optional input cards.
7. Various print options are provided to limit the amount of printed output.
8. WATEQF now consists of a main program and 5 subroutines, PREP, SET, MODEL, PRINT, and SAT. PREP reads the water data, converts the units of concentration to molality, and calculates all temperature dependent data at the temperature of the water

sample. SET initializes values of individual species for the iterative Mass Action - Mass Balance loop. MODEL calculates activity coefficients and solves Mass Action and Mass Balance equations for the species considered. PRINT prints the results calculated from the aqueous model, and SAT calculates and prints the thermodynamic saturation state of the water with respect to the various minerals considered by the program.

9. The method of convergence on Mass Balance for anions has been changed to a more accurate and rapid convergence method, essentially identical to the method used by Truesdell and Jones (1974) for Mass Balance on cations.
10. The aqueous model will not be solved on analyses if pH is outside the interval 3.0 - 11.0, or if there is greater than 30 percent error in charge balance. This procedure is useful in screening data for punching and/or errors in the analysis. The procedure can be ignored, however, with the appropriate option specified in the input.
11. There are several changes in the aqueous model over those of Truesdell and Jones (1973) as shown in Table 1 and Attachment B, although none results in major differences between the calculations of WATEQ and WATEQF for most natural waters. The choice of speciation, thermodynamic data, and activity coefficients used by WATEQF are in a continuous process of revision, as better data become available. The responsibility for final selection of constants used in WATEQF rests with the user.

INPUT

The data matrix of species considered and thermochemical constants is read initially, either from disk or cards. The format of the data matrix is summarized as follows:

Variables	Format
(NSPEC(I), Z(I), GFW(I), DHA(I), I=1,115)	(5X, A8, 2X, I2, 3X, F10.4, 1X, F4.1)
(NREACT(I), DH(I), LOGKTO(I), I=1,193)	(5X, A8, 2X, 2F10.4)

Following input of the data matrix, data cards for one or more water analyses are read. Each water analysis requires 5 cards (4 data cards followed by a blank card). WATEQF can receive additional data on option cards that fit into the data stream between card 4 and the blank card (5).

The required input for each water analysis is summarized as follows:

<u>Card</u>	<u>Variables</u>	<u>Format</u>	<u>Comments</u>
1	TITL	20A4	Title
2	TEMP, PH, EHM, EHMC, EMFZ, DENS, DOX, FLAG, CORALK, PECALC, IGO, (PRT(I), I=1,4) IDAVES, ISPEC, IMIN	(5(F6.0,1X), 2F5.0, 1X, 9I1, 2I3)	See description below
3	CUNITS(I) (I=1,2,3,4, 5,6)	(6E12.5,8X)	Ca,Mg,Na,K,Cl,SO ₄ (in order)
4	CUNITS(I) (I=7,35,8,45, 88,62)	(6E12.5,8X)	HCO ₃ ⁻ ,SiO ₂ ,Fe,PO ₄ , SR, F (in order)
-----Optional input appears here-----			
5	Blank card		Required to note end of data for a particular analysis

DESCRIPTION OF INPUT VARIABLES

NSPEC(I)	Names of the species
Z(I)	Charge of the species
GFW(I)	Gram formula wt. of <u>ith</u> species
DHA(I)	Debye-Hückel \bar{a} parameter for <u>ith</u> species
NREACT(I)	Name of <u>ith</u> reaction
DH(I)	ΔH_r° for <u>ith</u> reaction (Kcal/mole)
LOGKTO(I)	Log K for the <u>ith</u> reaction at 25°C
TITL	General description, identifying information, etc.
TEMP	Temperature in degrees C.
pH	Negative log of the activity of hydrogen ion.
EHM	"True" Eh of solution to which no temperature correction will be made (volts)

- EHMC** Electrical potential (volts) of the Eh cell with a calomel reference electrode.
- EMFZ** Electrical potential (volts) of the Eh cell with calomel reference in Zobell's solution.
- DENS** Solution density (g/cm³). If not known, read 1.0.
- DOX** Dissolved oxygen content (mg/l).
- FLAG** Signal for units of input concentrations (CUNITS).
1=meq/l, 2=mg/l, 3=ppm, 4=molality.
- CORALK** Carbon signal. Set to zero (or blank) if the alkalinity has not been corrected for silica, boron, etc. CORALK=1 if this correction has been made. Normally, one would report alkalinity as HCO₃⁻ (and CO₃²⁻ if detected) and set CORALK to zero. To input total carbon rather than alkalinity, set CORALK to 2. Total CO₂ can then be input as HCO₃⁻, or, if desired, as the individual species of HCO₃⁻, CO₃²⁻ and H₂CO₃^{*}. H₂CO₃^{*} and CO₃²⁻ are read on an optional "CONC" card.
(H₂CO₃^{*} denotes H₂CO₃⁰ + CO_{2aq}).
- PECALC** Signal for pe calculation. If PECALC = 0, pe is set to 100 and oxidation-reduction is ignored. =1 computes pe from Eh, =2 computes pe from dissolved oxygen, =3 computes pe from dissolved oxygen using the Sato (1960) relation, =4 computes pe from SO₄²⁻ / S²⁻.
- IGO** =0 or blank, if desired to have the data checked for possible input error or analytical error. pH must be greater than 3 and less than 11 and the analysis must have less than 30% error in charge balance. =1 if this check is not desired.
- PRT(I),**
I=1,4 Signals which when set to some non-zero value (say 1) omit print of: I=1, thermochemical data table; I=2, mass balance convergence iterations; I=3, ion ratios; I=4, mineral saturation calculations. To obtain the above printout, leave the appropriate value of PRT(I) blank or zero.
- IDAVES** Signal used to indicate desired method of calculation of activity coefficients, γ_i , of charged ion pairs. If 1, the Davies equation,

$$\log \gamma_i = \frac{-A Z_i^2 \sqrt{I}}{1 + \sqrt{I}} - 0.3I$$

is used. If zero, or blank, the Debye-Hückel equation,

$$\log \gamma_i = \frac{-A Z_i^2 \sqrt{I}}{1 + B a_i \sqrt{I}}$$

is used. A and B are constants that depend on the dielectric constant, density and temperature of the solvent, Z_i is the charge on the ion, I is ionic strength ($I = 1/2 \sum_i m_i Z_i^2$, where m_i is the molality of the *i*th ion), and a_i is the "ion size" parameter. As a general rule, the Davies equation is probably accurate to ionic strengths less than 0.5 and the Debye-Hückel equation is more accurate at ionic strength less than 0.1 (Stumm and Morgan, 1970). Activity coefficients of Ca^{++} , Mg^{++} , Na^+ , K^+ , Cl^- , SO_4^{--} , CO_3^{--} , and HCO_3^- are always calculated from the extended Debye-Hückel equations of Truesdell and Jones (1974).

ISPEC Number of species desired in output (if less than total number possible for the given water analysis). Leave ISPEC blank or zero to obtain output for all possible species for the defined system. If ISPEC is greater than zero, ISPEC values of KSPEC (species index numbers) must be read (Type 1 optional input; see below).

IMIN Number of minerals for which saturation data are required (if less than the total possible). Leave IMIN blank (or zero) to obtain saturation data on all possible minerals for the defined system. If IMIN is greater than zero, IMIN values of KMIN (mineral reaction index numbers) must be read (Type 1 optional input; see below).

Total concentration (units of FLAG) of Calcium (1), Magnesium (2), Sodium (3), Potassium (4), Chloride (5), Sulfate (6), Carbon, as HCO_3^- , (7), Silica, as SiO_2 , (35) Iron (8), Phosphate, as PO_4^{3-} (45), Strontium (88), and Fluoride (62), where the numbers in parentheses are the appropriate species index numbers in the program. To enter other species, use Type 2 optional input cards (see below).

DESCRIPTION OF OPTIONAL INPUT

Additional input is optional and must appear between cards 4 and 5. Two types of optional input cards are used, Type 1 and Type 2. If used, Type 1 optional input cards must precede Type 2 optional input cards.

Type 1 Optional Input

These cards are used to limit the number of species or minerals in the output. Omit these cards to obtain the complete calculated results for the given water analysis. To specify individual species for which output is desired, read ISPEC values of KSPEC(I),

<u>Variable</u>	<u>Format</u>
(KSPEC(I), I=1, ISPEC)	(16I5)

where KSPEC(I) is the index number of the *i*th species for which output is desired. Species index numbers are listed in the data tables of Attachment A. To specify individual minerals for which saturation data is desired, read IMIN values of KMIN(I),

<u>Variable</u>	<u>Format</u>
(KMIN(I), I=1, IMIN)	(16I5)

where KMIN(I) is the index number of the *i*th mineral reaction for which saturation output is desired. Mineral index numbers are listed in the data tables of Attachment A. If values of both KSPEC(I) and KMIN(I) are entered, KSPEC(I) must be read before KMIN(I).

Type 2 Optional Input

Type 2 optional input cards are used to (1) enter the total concentrations of species not included on cards 3 and 4 ("CONC" card(s)); (2) change the convergence tests on mass balance for anion species ("EROR" card); (3) change ΔH_T^0 ("DELH" card(s)); (4) change log K at 25°C ("TABL" card(s)); or, (5) change existing analytical expressions for logK(T), or enter new analytical expressions for reactions previously defined by the Van't Hoff equation ("LOGK" card(s)). It is possible to use none, 1,2,3, 4, or all 5 cases of type 2 optional input in a single data set, providing the sequencing is 1., "CONC", 2., "EROR", 3., "DELH", 4., "TABL", 5., "LOGK". The form of type 2 optional input cards is

<u>Variable</u>	<u>Format</u>
(WORD,(INT(I),VAL(I), I=1,5))	(A4,1X,5(I3,E12.5))

where WORD is "CONC", "EROR", "DELH", "TABL", or "LOGK". The meaning of INT(I) and VAL(I) is described below for each value of WORD.

"CONC" enters concentration (units of FLAG) of constituents not on card 3 and 4. INT(I) = 17 (H₂S), 18 (CO₃), 39 (NH₄), 51 (Al), 81(Li), 85 (NO₃), 86 (H₂CO₃), 87 (B), 90 (Ba), 98 (Br), and 101 (Mn). VAL (I) is the concentration of the INT(I) constituent.

"EROR" overrides pre-set mass balance convergence constraints on anions. Pre-set values of EROR1-EROR5 are 0.001 (0.1 percent error in mass balance). EROR1-EROR5 are entered on the "EROR" card as VAL (1) - VAL (5). In the order 1=carbon, 2=sulfate, 3=fluoride, 4=phosphate, 5=chloride. Values of INT(I) are not used.

"DELH" overrides values of the standard delta enthalpy of reaction (25 degrees C) used in computing the temperature dependence of equilibrium constants from the Van't Hoff equation. INT(I) is the index number of the ith reaction (see Attachment A) for which DH(I) is to be changed and VAL(I) is the appropriate new value of DH(INT(I)).

"TABL" overrides values of LOGKTO(INT(I)) (log K of reaction at 25 degrees C used in computing the temperature dependence of equilibrium constants from the Van't Hoff equation). INT(I) is the index number of the ith reaction (see Attachment B) for which LOGKTO is to be changed and VAL(I) is the appropriate new value of LOGKTO(I).

"LOGK" overrides existing analytical expressions for log K as a function of T (degree K), or enters as many as 35 new, previously undefined analytical expressions for log K (T degrees K). The form of the analytical expression must be

$$\text{Log } KT(\text{INT}(I)) = A + BT + C/T + DT^2 + E/T^2,$$

where T is temperature in degree K and A,B,C,D, and E are fit parameters (may be zero or blank). INT(1) is the index number of reaction (see Attachment A) and INT(2)-INT(5) are ignored. VAL(1)=A, VAL(2)=B, VAL(3)=C, VAL(4)=D, VAL(5)=E.

Values of A,B,C,D, and E for analytical expressions pre-set in the program are listed in the data tables of Attachment A. Note that the analytical expression for reaction (26) is further modified in the program (see card B1600 of Attachment B). If any of the cards, "EROR", "DELH", "TABL", "LOGK", are used in a particular water data set, calculations for that data set and all subsequent data sets will use the new input values. The last card in each water analysis data set must be blank, whether option cards are used or not.

OXIDATION-REDUCTION OPTIONS

There are several possible options that result from choosing appropriate values of EHM, EHMC, DOX, EMFZ, and PECALC. To specify Eh directly, the desired value should be read as EHM (in volts). This value of Eh will not be corrected for temperature. If the redox potential with Calomel reference was measured in the field and it is desired to correct that measurement for temperature, the measured value should be read as EHMC (in volts). EHM must then be greater than 9.0. Any value of EHMC less than 9.0 is then considered real and a temperature-corrected Eh (EHM) is computed. If no Eh was measured, EHMC and EHM should be greater than 9.0. If the Eh-Calomel of a standard Zobell's solution was measured in the field, read the value as EMFZ (in volts) and EHMC will be corrected. If EMFZ is greater than 9.0, EHMC will be corrected for temperature only (provided EHMC is less than 9.0).

Oxidation-reduction equations used in calculating the distribution of species are written in terms of pe. pe can be computed from Eh, dissolved oxygen, or $\text{SO}_4^- / \text{S}^-$. If PECALC = 1, pe is calculated from Eh. If PECALC = 2, pe is computed from dissolved oxygen. If PECALC = 3, pe is computed from dissolved oxygen using the relation of Sato (1960). If PECALC = 4, pe is computed from $\text{SO}_4^- / \text{S}^-$ (provided SO_4^- and total H_2S are entered). If PECALC = 0, redox relations are ignored. If pe is to be computed from dissolved oxygen, a real value of DOX must be read, and to calculate pe from Eh requires either a real value of EHM or EHMC to be read.

Six possible examples of redox options are tabulated and discussed below:

	EHM	EHMC	EMFZ	DOX	PECALC
1)	< 9	> 9	> 9	blank	1
2)	< 9	> 9	> 9	> 0.0	2
3)	> 9	< 9	> 9	blank	1
4)	> 9	< 9	> 9	> 0.0	2
5)	> 9	< 9	< 9	blank	1
6)	blank or >9	blank or >9	blank or >9	blank	0

- 1) Eh is to be used without correction and pe is to be computed from Eh.
- 2) Same as 1) but pe is computed from dissolved oxygen.
- 3) Eh was measured in the field and it is desired to correct that measurement for temperature. The Eh of standard Zobell's solution was not measured. pe is to be computed from Eh.
- 4) Same as 3) but pe is to be computed from dissolved oxygen.
- 5) Eh was measured in the field as well as the Eh of standard Zobell's solution. pe is to be computed from Eh.
- 6) No information on oxidation-reduction is available, and redox relations are to be ignored. (pe is set to 100)

Other possible options should be obvious from these examples.

OUTPUT

The output of WATEQF consists of a table of data constants used in the calculations (printed once). The output for each water analysis lists the title card and tabulates most of the input data. At the end of each iteration through the equilibria equations, the difference between the computed and analytical anion species is tabulated so that convergence progress can be followed. When convergence on the aqueous model has been obtained, various parameters that describe the solution are printed. Some of these are ionic strength, activity of water, comparison of computed and analytical charge balance, pH, pe, temperature, P_{CO_2} , P_{O_2} , total dissolved solids, and others. The concentration of each aqueous species (value greater than zero) is printed as ppm, molality, and activity, and log values, as well as ionic activity coefficients and their logs. Mole ratios and log activity ratios are computed and tabulated. The activity product of 101 minerals and their saturation index, ΔG_r and logK are printed. Saturation output for minerals in which the activity of an ith species in the reaction is zero are omitted from the tabulation. Parts of the output can be deleted with appropriate values of PRT(I), as described above, and by use of the ISPEC and IMIN options.

FROM : L. Niel Plummer

SUBJECT: Summary of Errors, changes and revision of WATEQF

1. Reaction 91 $\log K_{25} = +40.64$, $\Delta H_r^\circ = -65.44$. ΔH_r° is wrong in write up. Program is correct, however.
2. Table errors on ΔH_r° and $\log K_{25}$ for reaction 90. Correct $\Delta H_r^\circ = 4.9104$. Correct $\log K_{25} = 7.9869$. Analytical expression which is currently used in the program is correct.
3. Summation of mass balance on anions now precedes anion loop. Listing shows summation within anion loop. Printed mass balance in sea water test case in WRI 76-13 are erroneous owing to improper location of summation.
4. CaF^+ was enormously summed into $\text{CO}_{2\text{TOT}}$. See card E320.
5. If Fe or Mn are specified without redox information, the program will now set PE to zero, print a message stating that such has occurred, and continue calculation. Previously, the program would fail on iteration. With this change, the program will not fail but, of course, one should always supply desired redox information whenever iron and/or manganese are specified.
6. A new option for units of input concentration has been added. Millimoles per liter ($1000 \times M$) may be input. For this case, FLAG is set to zero.
7. In correcting titration alkalinity for non-carbonate alkalinity, a new option ($\text{CORALK} = 3$) has been added which considers all possible non-carbonate alkalinity species. This is similar to $\text{CORALK} = 0$ which considers only the major non-carbonate alkalinity species.
8. The values of EPM are now correctly calculated from PPM rather than molality.

9. Prints have been added to show:

- a) FLAG, CORALK, PECALC, IDAVES options
- b) charge balance in Meq/kg H₂O
- c) total alkalinity in Meq/kg H₂O
- d) carbonate alkalinity in Meq/kg H₂O

10. It is now possible to override an existing analytical expression with a Van't Hoff relation for the temperature dependence of equilibrium constants. This is done internally whenever an optional DELH or TABL card is used for a pre-existing analytical expression.

11. The minimum number of iterations required to solve the aqueous model within the mass balance limits has been changed from 5 to 2.

12. Corrections to WRI 76-13

a) Page 54, line 69 should read: $\text{CO}_3^{2-} + \text{H}^+ = \text{HCO}_3^-$

b) Page 57, line 127 should read: $\text{Li}^+ + \text{SO}_4^{2-} = \text{LiSO}_4^-$

13. Other changes have been made to improve the efficiency of the program which may be found by comparison of a current listing with that in WRI 76-13.

UNITED STATES GOVERNMENT

Memorandum

TO : Users of WATEQF - A FORTRAN IV version of WATEQ: DATE: May 17, 1977
A Computer Program for Calculating Chemical Equilibria
of Natural Waters

FROM : L. Niel Plummer, WRN, NR

SUBJECT: Change of resident disk for WATEQF and TABLES, and program revision.

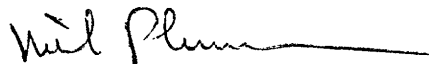

Due to a recent upgrading of on-line disk facilities in the Northeastern Region, it has been necessary to move the program WATEQF and data TABLES from the on-line disk CCD907 to CCD808. To use WATEQF off a Reston disk after May 17, 1977, your control language should be changed to indicate the new location of the program and data file (CCD808).

The following control cards will now execute the program:

```
/*RELAY PUNCH RE2
//...(JOB CARD)...
/*ROUTE PRINT REMOTEXX
//EXEC PGM=WATEQF,REGION=110K
//STEPLIB DD UNIT=3330,VOL=SER=CCD808,DISP=SHR,DSN=BFJONES.PGMLIB
//FT05F001 DD DDNAME=SYSIN
//FT06F001 DD SYSOUT=A
//FT07F001 DD SYSOUT=B
//FT09F001 DD UNIT=3330,VOL=SER=CCD808,DISP=SHR,
// DSN=BFJONES.TABLES.WATEQF
//SYSIN DD *
    Insert Water Analyses Here
//
$$$
```

In addition a revision of WATEQF has recently been completed. The more important changes are summarized on the attached memo dated April 21, 1977. You may obtain current listings or card decks of WATEQF by using one of the attached utility routines.

If you have any questions or problems, feel free to contact me.

L. Niel Plummer
Hydrologist

19. Garrels and Christ (1965).

Footnotes to Table 1

- 1/ No attempt has been made for internal consistency of thermodynamic data in WATEQF. Responsibility for selection of thermodynamic data rests with the user. The revised thermodynamic data of Table 1 do not reflect the forthcoming revision of U.S. Geological Survey Bulletin 1259 which may have profound effects on the thermodynamic data for Aluminium.
- 2/ The ion pairs $Na_2CO_3^{\circ}$ and $Na_2SO_4^{\circ}$ are no longer used in WATEQF. The CaF^{+} ion pair has been added to the model.
- 3/ This analytical expression for the calcite equilibrium constant assumes that the ion pair $CaHCO_3^{+}$ is present in the aqueous model. If $CaHCO_3^{+}$ is deleted from the model via an optional LOGK card (by setting $\log K_{CaHCO_3^{+}}$ to, for example, to -30.), $\log K_{calcite}$ should be changed to $13.870 - 0.04035T - 305.9./T$, as recommended by Jacobson and Langmuir (1974).

4/ Reactions 36 and 63 have been changed from dissociation (in WATEQ) to association in WATEQF. For the most part, all ion pair reactions are written as association in WATEQF, that is, most ion pair equilibria show the pair as a product. All mineral equilibria are written with the solid as reactant. See Attachment C for details of all reactions in WATEQF.

Attachment B: Program Listing

C	**** PROGRAM WATECF **** A FORTRAN IV VERSION OF WATEQ	A	10
C		A	20
C	REVISED FROM PL1 VERSION OF TRUESDELL AND JONES.	A	30
C	NIEL PLUMMER, SUMMER 1972.	A	40
C	LATEST REVISION AUGUST, 1976.	A	50
C		A	60
C		A	70
C	**** DESCRIPTION OF INPLT - 5 CARDS ARE REQUIRED ****	A	80
C	CARD 1 TITLE, JCB DESCRIPTION. (20A4)	A	90
C	CARD 2 TEMP,PH,EHM,EHMC,EHMZ,DENS,DOX,FLAG,CORALK,PECALC,IGO,	A	100
C	(PRT(I),I=1,4),IDAVES,ISPEC,IMIN	A	110
C	(5(F6.0,1X),2F5.0,1X,9I1,2I3)	A	120
C	TEMP....TEMPERATURE IN DEGREES C	A	130
C	PH.....NEGATIVE LOG ACTIVITY H+	A	140
C	EHM.....PREFERRED EH ...SEE OPTIONS	A	150
C	EHMC....MEASURED EH ... SEE OPTIONS	A	160
C	EHMZ....MEASURED EH OF ZOBELL SOLUTION	A	170
C	DENS....DENSITY OF SOLUTION (G/CC)	A	180
C	DOX.....DISSOLVED OXYGEN (MG/L)	A	190
C	FLAG....SIGNAL FOR UNITS OF INPUT CONCENTRATION.	A	200
C	1=MEQ/L, 2=MG/L, 3=PPM, 4=MOLALITY, 0 = <i>WILL BE CORRECTED</i>	A	210
C	CORALK..=0 IF ALKALINITY HAS NOT BEEN CORRECTED FOR BORON ETC. <i>(MAY BE)</i>	A	220
C	=1 IF THE CORRECTION HAS BEEN MADE. =2 IF TOTAL CO2 IS INPLT	A	230
C	RATHER THAN ALKALINITY. =3 <i>CORRECTS FOR ALL POSSIBLE NON-CARBONATE ALKALINITY SPECIES</i>	A	240
C	PECALC..=0 WILL SET PE TO 100, =1 COMPUTES PE FROM EH,	A	250
C	=2 COMPUTES PE FROM DOX(THEORETICAL). = 3 COMPUTES PE FROM	A	260
C	THE SATO RELATION, = 4 COMPUTES PE FROM S-- - 504--.	A	270
C	IGO..=0,OR BLANK, IF DESIRED TO HAVE DATA CHECKED FOR INPUT	A	280
C	ERROR. PH MUST BE GREATER THAN 3 AND LESS THAN 11, AND THE	A	290
C	ANALYSIS MUST HAVE LESS THAN 30% ERROR IN CHARGE BALANCE. =1	A	300
C	IF THIS CHECK IS NOT TO BE MADE.	A	310
C	(PRT(I),I=1,4), CAN BE SET TO 1 TO DELETE PRINT OF	A	320
C	THERMOCHEMICAL DATA,MASS BALANCE CONVERGENCE ITERATIONS,	A	330
C	RATIOS OF IONS, AND MINERAL SATURATION, RESPECTIVELY. PRT(I)	A	340
C	SHOULD BE SET TO ZERO OR BLANK TO OBTAIN THE RESPECTIVE PRINT.	A	350
C	IDAVES..=1, ACTIVITY COEFFICIENTS OF CHARGED ION PAIRS ARE	A	360
C	CALCULATED FROM THE DAVIES EQUATION. =0 (OR BLANK), ACTIVITY	A	370
C	COEFFICIENTS OF CHARGED ION PAIRS ARE CALCULATED FROM THE	A	380
C	DEBYE-HUCKEL EQUATION. IDAVES HAS NO EFFECT ON GAMMA(1)-	A	390
C	GAMMA(7), AND GAMMA(18).	A	400
C	ISPEC.. = NUMBER OF SPECIES DESIRED IN OUTPUT(IF LESS THAN TOTAL	A	410
C	POSSIBLE). TO OBTAIN OUTPUT OF MOLALITY, ACTIVITY, ETC. OF	A	420
C	ALL POSSIBLE SPECIES FOR THE DEFINED SYSTEM, LEAVE ISPEC	A	430
C	BLANK (OR ZERO). IF ISPEC GT. ZERO, ISPEC VALUES OF KSPEC	A	440
C	(SPECIES INDEX NUMBER) MUST BE READ (SEE BELOW). IF ISPEC =	A	450
C	BLANK (ZERO), OMIT KSPEC CARD(S).	A	460
C	IMIN.. = NUMBER OF MINERALS FOR WHICH SATURATION OUTPUT IS	A	470
C	DESIRED (IF LESS THAN TOTAL POSSIBLE). TO OBTAIN SATURATION	A	480
C	DATA ON ALL POSSIBLE MINERALS FOR THE DEFINED SYSTEM, LEAVE	A	490
C	IMIN BLANK (OR ZERO). IF IMIN GT. ZERO, IMIN VALUES OF KMIN	A	500
C	(MINERAL INDEX NUMBER) MUST BE READ (SEE BELOW). IF IMIN =	A	510
C	BLANK (OR ZERO), OMIT KMIN CARDS(S).	A	520
C	CARD 3 CA MG NA K CL S04 (6(E12.5),8X)	A	530
C	CARD 4 HCO3 SIC2 FE P04 SR F (6(E12.5),8X)	A	540
C	... OPTIONAL CARDS OF TYPE 1 APPEAR HERE ...	A	550
C	... OPTIONAL CARDS OF TYPE 2 APPEAR HERE ..	A	560
C	CARD 5 BLANK CARD (DENOTES END OF DATA FOR A PARTICULAR	A	570
C	WATER ANALYSIS.)	A	580
C		A	590
CDESCRIPTION OF OPTIONAL INPUT....	A	600
C	ALL OPTIONAL INPUT MUST APPEAR BETWEEN CARDS 4 AND 5.	A	610

C	TYPE 1 CARDS MUST PRECEED TYPE 2 CARDS.	A	620
C		A	630
C	*****	A	640
C	TYPE 1 OPTIONAL INPUT CARDS	A	650
C	*****	A	660
C	(KSPEC(I),I=1,ISPEC) (1615) KSPEC(I) IS THE INDEX NUMBER OF THE	A	670
C	ITH SELECTED SPECIES FOR WHICH OUTPUT IS DESIRED. OMIT CARD	A	680
C	IF ISPEC = BLANK (OR ZERO).	A	690
C	(KMIN(I),I=1,IMIN) (1615) KMIN(I) IS THE INDEX NUMBER OF THE	A	700
C	ITH SELECTED MINERAL FOR WHICH SATURATION OUTPUT IS DESIRED.	A	710
C	OMIT CARD IF IMIN = BLANK (OR ZERO).	A	720
C	NCTE THAT IF BOTH KSPEC AND KMIN ARE READ, KSPEC(I) MUST BE READ	A	730
C	BEFORE KMIN(I).	A	740
C		A	750
C	*****	A	760
C	TYPE 2 OPTIONAL INPUT CARDS	A	770
C	*****	A	780
C	WCRD,(INT(I),VAL(I),I=1,5) (A4,1X,5(I3,E12.5))	A	790
C	WCRD = 'CONC', 'EROR', 'DELH', 'TABL', OR 'LOGK'.	A	800
C		A	810
C	'CONC'..ENTERS CONCENTRATION (UNITS OF FLAG) OF CONSTITUENTS	A	820
C	NOT ON CARDS 3 AND 4. INT(I) = 17(H2S),18(CO3),39(NH4),51(AL),	A	830
C	81(LI),85(NC3),86(H2CC3),87(B),90(BA),98(BR),AND 101(MN).	A	840
C	VAL(I) IS THE CCNCENTRATION OF THE INT(I) CONSTITUENT.	A	850
C		A	860
C	'EROR'..OVERRIDES PRE-SET MASS BALANCE CONVERGENCE CONSTRAINTS	A	870
C	ON ANIONS. PER-SET VALUES OF EROR1-ERORS ARE 0.001(0.1% ERROR	A	880
C	IN MASS BALANCE). EROR1-ERORS ARE ENTERED ON THE 'EROR' CARD	A	890
C	AS VAL(1)-VAL(5), IN THE ORDER 1=CARBON, 2=SULFATE, 3=FLUORIDE,	A	900
C	4=PHOSPHATE, 5=CHLORIDE. VALUES OF INT(I) ARE NOT USED.	A	910
C		A	920
C	'DELH'..OVERRIDES VALUES OF THE STANDARD DELTA ENTHALPY OF	A	930
C	REACTION (25 DEG. C) USED IN COMPUTING THE TEMPERATURE	A	940
C	DEPENDENCE OF EQUILIBRIUM CONSTANTS FROM THE VANT HOFF EQUATION.	A	950
C	INT(I) IS THE INDEX NUMBER OF THE ITH REACTION FOR WHICH DH(I)	A	960
C	IS TO BE CHANGED AND VAL(I) IS THE APPPPRIATE NEW VALUE OF	A	970
C	DH(INT(I)).	A	980
C		A	990
C	'TABL'..OVERRIDES VALLES OF LOGKTO(INT(I)) (LOG K OF REACTION AT	A	1000
C	25 DEG. C USED IN COMPUTING THE TEMPERATURE DEPENDENCE OF	A	1010
C	EQUILIBRIUM CONSTANTS FROM THE VANT HOFF EQUATION). INT(I) IS	A	1020
C	THE INDEX NUMBER OF THE ITH REACTION FOR WHICH LOGKTO IS TO BE	A	1030
C	CHANGED AND VAL(I) IS THE APPROPRIATE NEW VALUE OF LOGKTO(I).	A	1040
C		A	1050
C	'LOGK'..OVERRIDES EXISTING ANALYTICAL EXPRESSIONS FOR LOG K AS A	A	1060
C	FUNCTION OF T(DEG.K), OR ENTERS NEW, PREVIOUSLY UNDEFINED	A	1070
C	ANALYTICAL EXPRESSIONS FOR LOG K(T DEG.K). THE FORM OF THE	A	1080
C	ANALYTICAL EXPRESSION MUST BE	A	1090
C	LOG KT(INT(I))=A+B*T+C/T+D*T**2+E/T**2	A	1100
C	WHERE T IS TEMPERATURE IN DEG. K, AND A,B,C,D, AND E ARE FIT	A	1110
C	PARAMETERS (MAY BE ZERO OR BLANK). INT(1) IS THE INDEX NUMBER	A	1120
C	OF REACTION AND INT(2)-INT(5) ARE IGNORED. VAL(1)=A,VAL(2)=B,	A	1130
C	VAL(3)=C,VAL(4)=D,VAL(5)=E.	A	1140
C		A	1150
C		A	1160
C	IF ANY OF THE CARDS, 'EROR','DELH','TABL','LOGK', ARE USED IN A	A	1170
C	PARTICULAR WATER DATA SET, CALCULATIONS FOR THAT DATA SET AND ALL	A	1180
C	SLRSEQUENT DATA SETS WILL USE THE NEW INPUT VALUES. THE ORDER OF	A	1190
C	TYPE 2 OPTIONAL INPUT CARDS IS 'CONC','EROR','DELH','TABL',AND	A	1200
C	'LOGK', IF ALL 5 ARE USED. THE LAST CARD IN EACH WATER ANALYSIS	A	1210
C	DATA SET MUST BE BLANK, WHETHER OPTION CARDS ARE USED OR NOT.	A	1220
