Approaches developed to ensure accuracy and consistency of metadata for TRAIL reports

Making Government Documents Findable

TRAIL Collection

There are special aspects for quality control implemented to safeguard accuracy and consistency in the digital library.

UNT libraries focused on two issues which are completeness and dates distribution because calculations could be established and the issues are measureable.

Completeness

The UNT libraries metadata guidelines define a minimally-viable record as having values for each of the eight required fields include: (main title, language, content description, subject, collection, institution, resource type, and format.

The guidelines help to ensure the records are complete to ensure the records are findable to the user.
